AGRICULTURE. In European Russia 74.9 per cent. of the people are engaged in agriculture; in the Caucasus, 78.8; Siberia, 80.2; Central Asia, 82.8; Poland, 56.6. European Russia produces 89.83 per cent. of the total wheat crop, 96.7 per cent. of the rye, 98 of the barley, 92 of the oats, and practically all of the corn crop. The area in European Russia proper divided among peasant proprietors averages about 33.75 acres each. Out of a total of 102,935,619 desiatines (1 desiatine=2.7 acres) under private ownership at the beginning of 1909, 26,812,251 belonged to the peasants, 49,361,865 to the nobles, 16,093,974 to merchants, etc. To the crown, churches, etc., belonged 154,689,573 desiatines additional; and to corporations, 15,778,677.

The peasant, prospered by the abundant harvests of 1909 and 1910, is beginning to expend money for agricultural implements; and the Peasants' Land Bank, by furnishing loans with which to buy up-to-date equipment, is stimulating agricultural development. The coöperative associations are also an important economic factor.

The area and production of the great cereal crops are given below according to official reports (annual averages 1906-8, 1909, and 1910):

	1000 acres			1000 bushels*		
	1906-8	1909	1910	1906-8	1909	1910
a	15,578	15,202	15,819	182,780	206,831	248,000
b	46,359	49,506	55,223	345,714	569,114	527,000
c	71,780	70,443	69,635	735,564	883,739	854,000
d	1646	1,418	1,393	16,771	12,181	13,000
e	25,013	26,703	28,443	347,775	473,524	458,991
f	46,690	46,205	47,334	852,895	1,144,243	1,045,990
g	2,499	3,802	3,660	61,008	39,906	77,607
h	3,415	5,326	45,738	53,503	57,677

a Winter wheat; b spring wheat; c winter rye; d spring rye; e barley; f oats; g corn; h buckwheat.

* Bushels of 60 pounds wheat, 56 pounds rye and corn, 48 barley and buckwheat, 32 oats.

Yield of millet, 1906-8 annual average, 87,166,000 bu.; 1909, 125,135,000; 1910, 120,135,000. Potatoes, 1906-8, 1,082,585,000 bu.; 1909, 1,200,766,800; 1910, 1,339,072,800. Sugar-beets, 1909, 6,800,000 tons. Area (1910) under flax, 3,887,259 acres; under hemp, 2,601,036; tobacco (1909), 156,576; under cotton (in Central Asia), 687,000.

Expressed in hectares and thousands of quintals, figures are given below for acreage under great crops in 1911, as compared with 1910, and yield for the two years (1911 preliminary), together with the yield per hectare in 1910. E.=European Russia (63 governments), A.=Asiatic Russia (10 governments).

	Hectares		1000 quintals		Qs. p.ha.

*Including Asiatic Russia.

Under forest in the entire empire, 1,822,500,000 acres; in European Russia proper, 474,000,000 acres; Finland, 50,500,000; Poland, 6,700,000; Caucasus, 18,600,000. The government owns 65 per cent. of the total forests of the empire; 23 per cent. is owned by the landed proprietors, and 9 per cent. by the peasantry. The value of the timber industry to the government as a source of revenue is shown by the receipts—70,000,000 roubles in 1910.

Dairy-farming has made rapid progress. The export of butter was in 1897, 529,000 poods (36 lbs.=1 pood); in 1907, 3,638,000; in 1909, 3,540,000 (value, 48,404,000 roubles). In 1909, 23,472,658 great hundreds (of 120) of eggs were exported. Large quantities of poultry are shipped to neighboring countries. Livestock

(1909): 32,114,000 horses, 48,491,000 cattle, 79,562,705 sheep and goats, 12,651,298 swine. See also article AGRICULTURE.

MINING AND METALS. In proportion to the vast mineral wealth of the empire, the mining industry is insufficiently developed. The absence of practicable roads, the necessity for the importation of most of the requisite machinery, difficulties in the way of exploitation due to the great distances to be traversed and the lack of transportation facilities, together with want of organization and equipment and the government's disinclination to encourage foreign enterprise, combine to prevent adequate progress.

In 1907, 304,588 persons were reported as engaged in mines and quarries. The production in 1907 was as follows: Gold, kilos, 31,118; platinum, kilos, 5301; silver, kilos, 2141; lead, tons, 512; zinc, tons, 9955; copper, tons, 13,037; pig-iron, tons, 2,773,000; iron and steel, tons, 2,364,000; coal, tons, 24,537,000; petroleum, tons, 7,675,000; salt, tons, 1,836,000. Ninety per cent. of the world's supply of platinum comes from Russia. The 1909 output of copper, 18,130 tons, is the highest recorded; the total consumption for the year was 21,565 tons. Russia will soon be independent of imports for her copper. In spite of the presence of enormous coal deposits, the coal industry has steadily declined, owing, it is claimed, to the return by the railroads to the use of liquid fuel. The 1910 output from the Donetz Basin, where cholera has prevailed, was estimated at only 14,012,903 tons; in the Urals, to about 580,234 tons. Further unofficial figures for 1910 place the asbestos output at 24,406,776 pounds, silver, 284,126 ounces; platinum, 12,045 pounds; copper, 49,804,416 pounds; petroleum from the Baku district, 7,717,742 tons, and the total output of the empire 9,193,458 tons; salt, 287,270 tons; iron-ore from the Donetz Basin, 4,359,677 tons. Pig-iron (1909), 175,295,000 poods; worked iron and steel, 160,034,000 poods.

MANUFACTURES. Total number of manufacturing under state supervision January 1, 1910, 14,710, employing 1,831,396 persons. Number of distilleries (1909-10), 2809; output of alcohol, 114,278,000 gallons. Sugar works (1909-10), 277; area under beetroot, 1,666,108 acres; sugar production, 85,856,000 poods. About 80,000 hands are employed in the timber industry; value of total annual output, 155,000,000 roubles. Flax, hemp, and jute factories, 414; employees 52,000; annual production (about), 73,000,000 roubles. Cotton spinning and weaving mills, 140; employees, 399,900; spinning spindles, 8,132,338; twist spindles, 322,145; looms, 139,964; value of annual production (about), 607,000,000 roubles.

FISHERIES. The opening of the Tashkent Railway has given an impetus to fishing in the Aral and Inland Sea. Russia held second place in the world's production in 1893; but lack of transportation and refrigeration facilities predestine the bulk of the annual catch to home consumption or waste. In 1906 the fish traffic on Russian lines amounted to 44,453,000 poods (19,062,000 poods of herrings, 16,889,000 of smoked and dried fish, 345,000 of caviare).

COMMERCE. The most notable feature of Russian trade during the last decade is Germany's success in becoming the dominating factor in it; and in proportion as Germany has gained influence, Great Britain has lost it. Of the total imports in 1909 Great Britain supplied 17,

Germany 43 per cent.; of foodstuffs, 7 and 25; raw materials and partly manufactured articles, 20 and 38; manufactures, 14 and 67. Another noteworthy feature is the increase in the export of cereals, particularly wheat, since 1905 (see table of cereal exports). Statistics given in the following tables will show totals and details for successive years.

Total trade of the empire in roubles:

	1907	1908	1909
Imps.: mdse.	847,365,000	912,659,000	906,336,000
Gold, silver	10,937,000	28,226,000	46,284,000
Exps.: mdse.	1,053,010,000	998,250,000	1,427,675,000
Gold, silver	13,108,000	18,910,000	27,806,000

Preliminary figures for 1910 place the imports at 1,178,397,000 roubles, and the exports at 1,493,352,000 roubles; imports and exports of gold and silver in money and ingots at 71,281,000 and 32,157,922 roubles.

Table of principal articles imported and exported in the trade of the empire in 1909 (thousands of roubles):

Imports	1000 r.	Exports	1000 r.
Cotton	97,059	Cereals and flour	723,579
Machinery, etc.	96,938	Timber	126,575
Tea	59,241	Flax and tow	67,921
Woolens	44,508	Eggs	62,213
Metal mfrs.	38,742	Butter	48,862
Coal, etc.	32,036	Petroleum	34,752
Fish	29,939	Oil cake	33,649
Rubber	24,146	Sugar	28,233
Metals	23,893	Bran	26,515
Silks	20,773	Seeds	26,160
Paper, etc.	20,402	Hides	23,707
Yarn	18,763	Cottons	23,401
Plants, seeds	17,682	Metals	22,821
Fruits	17,378	Live animals	20,792
Leather, etc.	17,249	Hemp and tow	12,433

The bulk of the Russian trade goes by way of the European frontier, the Black Sea frontier of the Caucasus, and to and from Finland. The tables below show this trade for successive years.

Trade by great classes, in thousands of roubles (a—foodstuffs; b—raw and half raw materials; c—animals; d—manufactured articles):

	Imports			Exports		
	1908	1909	1910	1908	1909	1910
a	126,304	116,810	121,403	517,944	900,371	901,080
b	410,907	411,137	516,381	370,719	417,062	430,218
c	1,480	1,553	3,070	23,386	25,058	28,948
d	221,743	256,413	312,204	26,720	24,675	23,412
	760,434	785,913	953,058	938,769	1,367,161	1,383,658

Table of cereal exports (1908 and 1909):

	1000 poods		1000 roubles	
	1908	1909	1908	1909
Wheat	89,600	314,229	112,889	384,128
Rye	24,902	35,528	25,995	34,160
Barley	161,278	219,160	132,579	165,864
Oats	29,358	74,652	24,513	61,761
Millet	707	2,055	544	1,565
Buckwheat	1,361	1,559	1,380	1,490
Corn	36,507	41,143	28,578	31,134
Peas	7,060	9,139	7,105	10,403
Other legumes	7,258	10,869	7,519	11,394
Groats	746	851	1,240	1,385
Wheat flour	2,910	5,370	5,619	10,490
Rye flour	6,163	6,934	7,165	7,664
Other flour	47	178	62	196
Bran	31,625	38,975	20,244	26,508

Comparing the average export 1904-1908 with the export in 1909 we find among the increases, the following: butter, 30,404,000 roubles (average 1904-1908) and 48,404,000 roubles (1909); eggs, 55,904,000 and 62,212,000; timber, 93,047,000 and 126,092,000; seeds of forage plants, 5,300,000 and 10,229,000; platinum, 5,044,000 and 12,200,000; hops, 316,000 and 757,000. Oleaginous seeds declined from 20,321,000 roubles in 1908 to 14,478,000 in 1909; cotton goods, from 1,451,000 to 1,044,000. Imports of foodstuffs declined by 7.5 per cent. and imports of manufactured goods increased by 16.8 per cent.

Preliminary figures for 1910 place the imports of merchandise at 953,058,000 and the exports at 1,383,658,000 roubles, distributed among the principal countries of origin and destination and compared with figures for 1908 as follows (values in thousands of roubles):

	Imports		Exports	
	1908	1910	1908	1910
Germany	331,794	440,951	278,863	390,600
Great Britain...	119,868	153,547	220,089	314,975
United States...	74,467	73,894	2,815	9,482
France	35,719	59,368	64,550	93,699
Finland	28,750	35,990	48,762	42,859
Aus.-Hun.	26,424	34,136	48,968	49,498
Netherlands	11,485	19,312	93,533	195,982
D. E. Indies....	16,235	17,816	304	15
China	14,715	12,416	1,236
Italy	12,944	16,892	29,936	75,189
Egypt	13,792	10,144	3,638	3,310
Turkey	7,099	10,103	21,521	26,543
Denmark	8,739	7,709	31,491	26,531
Sweden	10,112	7,653	4,723	8,903
Norway	8,361	6,521	5,752	6,155
Belgium	8,063	6,940	34,391	66,464
Switzerland	4,589	7,710
Rumania	2,766	2,226	12,823	15,056
Others	24,522	29,730	36,610	57,180
Totals	760,434	953,058	938,769	1,383,658

Across the Asiatic frontier additional exports in 1909 were sugar (12,328,000 roubles), and cotton goods (21,519,000); imports, rice (7,025,000), and raw cotton (9,534,000).

SHIPPING. The shipping entered and cleared at all ports in the foreign trade of the empire during 1909 is shown in the following table:

Ports	Entered		Cleared	
	No.	Tons	No.	Tons
White Sea	1,119	851,000	1,084	851,000
Baltic	7,135	5,299,000	7,205	5,373,000
Black & Azov..	4,920	7,075,000	4,753	6,848,000
Pacific Coast..	635	784,000	613	737,000
Total	13,808	14,009,000	13,655	13,809,000

Coasting vessels (1908) touching at ports of the White, Baltic, Black, Azov, and Caspian seas, the Danube, and the Pacific Coast, 70,553, aggregating 30,680,000 tons. Merchant marine January 1, 1911: White Sea, 58 steamers (12,038 tons) and 410 sailing vessels (23,397 tons); Baltic, 207 (102,964) and 745 (78,613); Black Sea and Sea of Azov, 403 (200,393) and 780 (43,888); Caspian, 250 (119,254) and 561 (114,118). Total, 3447 vessels of 723,562 tons.

COMMUNICATIONS. An examination of the budget for 1910 shows an (extraordinary) appropriation of 64,110,310 roubles for the construction of new railways; for 1911, of 95,218,165 roubles.

Much new railway construction was in pro-

gress during 1911, the most important perhaps being a new connection between St. Petersburg and the Siberian Railway. This extends from Perm through Ekaterinburg and Tiumen to Omsk on the Siberian Transcontinental. The line to Ekaterinburg was finished early in the year and the remainder of the work is in progress. A narrow-gauge line from Herby on the German frontier, which connects with the existing Dombrova-Vistula Railway at Kielee was opened during the year. It is 81 miles in length and runs via Czestochowa. There was considerable discussion of new railway projects in hand, and surveys were being made between the Siberian Railway and the Black Sea ports, and also across the Caucasus.

The double-tracking of the Siberian railway is in progress. In order to connect Peking directly with the European system, a line is to be built from Peking north through Eastern Mongolia (section from Peking to Kalgan, 135 miles, is already in operation). Following the great caravan route across Eastern Mongolia, the line will join the Siberian system via Kiakhta south of Lake Baikal (length of section, 1000 miles). When the line is completed the railway mileage from Paris to Peking will be 6300 continuous miles (9½ days). A new Amur line is to be begun shortly, and by 1915 the double-track line from the Urals to the Pacific (6862 miles) is to be finished.

In 1911 concessions were granted to six private railways with an aggregate length of 1750 versts (1150 miles) and entailing an aggregate cost of 119,883,850 roubles. The last concession in the year applied to the Black Sea-Kuban Railway, which comprises two lines, crossing each other in that portion of the Kuban district bordering upon the Azov Sea. These two lines have an aggregate length of 280 miles; the one proceeds from Krymskoja station on the Vladikavkaz Railway, in the neighborhood of Novorossisk, to Kuschitchevka, a station on the main line of the same railway from Rostov to Vladikavkaz, while the other line leads from Ekaterinodar to Primorsko-Achtanskaja, on the Azov Sea. The cost was calculated at close upon 20,000,000 roubles. Some additional side and branch lines brought the above-mentioned aggregate of concessioned private railways during the year up to a total of 1150 miles, against 290 miles in 1910, 300 miles in 1909, 1320 miles in 1908, 185 miles in 1907, 100 miles in 1906, and 15 miles in 1905. The unusually large figure for 1908 was to a great extent attributable to the North Donetz Railway. With such large projects under way it was anticipated that there would be less disposition on the part of the government to further railway concessions. This, however, did not prevent additional railway projects being prepared. A large number of applications for concessions were made to the authorities during the year in the first quarter, for instance, 43 applications, against 55 for the whole of 1910, and 42 in 1909. Among the plans likely to be first realized were the Moscow-Kasan and Vladikavkaz Railway, besides several railway projects in central Asia, upon the financing of which interested parties had been engaged for some time. The Podolian Railway Company, which had raised the capital in Germany for the construction of its trunk line, was considering fresh projects, comprising the building of a railway from Slobin via Masyr, Ovratch, Nov-

gorod, Volynsk to Scheptowka, and one from Storokonsantinov to Shmerinka. Should the Podolian Railway Company secure the concession for the former of these two schemes, it would mean a direct railway from St. Petersburg to the Austrian frontiers.

Railways in operation January 1, 1911: European Russia, 55,646 kilometers (State, 36,449; companies, 16,865; short local lines, 2332); Asiatic Russia, 16,892. Total, 72,538 kilometers (45,073 miles). State telegraphs (1909), 175,720 kilometers (wires, 472,858 kilometers); police lines, 389 (389); railway lines, 14,813 (205,874); company lines, 4175 (8458): total, 195,097 kilometers (wires, 687,588). Telegraph offices: 3783 State, 4168 other. Telephone lines (1909): 11,270 kilometers urban (wires, 384,622 kilometers); inter-urban, 1051 (4137). Post offices, 14,963.

Length of rivers open to navigation, 24,649 miles; 10,396 more are available for the towing of loaded barges downstream, and 18,122 for floating timber rafts: a total of 53,167 miles. Length of all navigable waterways (rivers, canals, and lakes), 102,600 miles, of which 49,625 are in European and 52,605 in Asiatic Russia. Length of road of all kinds, 707,628.4 versts (0.062897 mile=1 verst): 459,110.7 versts in European Russia proper, 65,482.9 in Poland, 18,436.4 in the Caucasus, 108,152.5 in Siberia, 56,445.0 in central Asia.

FINANCE. The unit of value is the rouble, worth 51.5 cents. The revenue and expenditure, ordinary and extraordinary, are given as follows in roubles (1910 and 1911 budget estimates):

	1909	1910	1911
Rev. ord....	2,526,340,888	2,580,063,497	2,707,708,827
" extraord.	162,744,206	11,624,383	12,400,000
Total	2,689,085,094	2,591,687,880	2,720,108,827

* Preliminary.

The public debt stood, January 1, 1911, at 9,014,141,796 roubles.

ARMY. The modernization and reorganization of the Russian army taking place in 1911 included the formation of new army corps from reserve troops and other organizations formed at the time of the Russo-Japanese War. Three of these new corps were to be located in European Russia, one in the Caucasus, and two in Siberia and the far East. There were 27 army corps in European Russia, 3 in the Caucasus, 2 in Turkestan, and 5 in Siberia and the far East. These form several armies, that in Russia proper being organized on strictly European lines, while those in the Caucasus, Turkestan, and the Amur regions have an organization influenced by local conditions, though great improvements were taking place in some districts where military training for the inhabitants was being introduced. Estimates vary greatly concerning the strength of the Russian army. Returns for its peace strength, considering only the officers and men serving with the colors, published during the year in military journals, gave the distribution and numbers of troops as follows: Infantry 580,000, cavalry 115,000, field artillery 94,110; foot artillery 18,056, coast artillery 14,152, technical troops, 37,448, total peace strength 1,200,000. The fighting strength of the three arms, namely, the infantry, cavalry, and artillery on mobilization, considering only the existing organization, has been estimated as follows: Infantry rifles 973,152, cavalry sabres 11,825, field guns 4432, sabres per thousand infantry bayonets 114.91, field guns per thousand infantry bayonets 4.55, fully trained reserves available for passing from peace to war footing 3,800,000.

In the Russian army the liability to personal service extends from the 21st to the 43rd year of each male inhabitant, and there is available each year a contingent of over a million men of suitable age. For those joining the active army the period of service is three years with the colors, four in the case of the cavalry, thirteen in the reserve, and the remainder of the period in the Opoltschenié, or militia. This last organization, which was being formed in 1911, includes in addition to those who have served with the colors and in the reserve some 220,000 each year, who are not needed for the active army. It was desired to make it a valuable support so that in time of war it would furnish organized troops.

An interesting military event has been the reduction of the forces on the German and Austrian frontiers by three army corps and one and one-half cavalry divisions, and the strengthening of the St. Petersburg district, and the redistribution of troops in central Russia, so that more rapid mobilization and availability for action from a central point would be possible.

An important part of the Russian army is the Cossacks, which furnish a cavalry that is an essential element in the organization. The Cossacks have their own organization, liability to service beginning at the eighteenth year. The first period of three years is local service, but for twelve years thereafter they are enrolled in the active forces either with the first ban, which is actually serving, or with the second or third, which are on unlimited leave. The peace effective of the Cossacks with the colors was estimated in excess of 50,000, and on a war basis

this number could be increased to some 150,000, of which number 4000 would be officers.

Aviation was being actively practiced during the year and a school for officers was established. The officers permitted to take the course for the year 1911-1912 comprised 84 officers, 40 engineers, and 8 from the navy. A course regarding the material for aeroplanes was included and aeroplanes were secured from many of the best European makers. Before admission all the officers were submitted to a special medical examination, which was extremely rigorous. See MILITARY PROGRESS.

NAVY. The number and displacement of war ships of 1000 tons and over, and of torpedo craft of 50 tons and over, built and building, December 1, 1911, are placed at 211, of 473,879 aggregate tons, detailed as follows: Battleships (10,000 tons and over), 16, of 280,250 aggregate tons (of which, building, 7, of 158,000). Coast-defense vessels, 2, of 10,380 aggregate tons. Cruisers, 6 armored cruisers, 63,500 aggregate tons; 7 first-class cruisers (6000 tons and over), 46,460; 2 second-class (6000 to 3000 tons), 6385; 2 third-class (3000 to 1000 tons), 2680. Torpedo-boat destroyers, 108, of 49,050 (of which, building, 13, of 13,260). Torpedo boats, 29, of 3722. Submarines, 39, of 11,448 (of which, building, 8, of 4800). Total vessels built, 183, of 297,819 aggregate tons; building, 28, of 176,000.

During 1911 the four dreadnoughts (92,000 aggregate tons) whose keels were laid June 16, 1909, were launched—the *Sevastopol* June 29, the *Poltava* July 10, the *Petrovavlovsk* September 9, the *Gangut* October 7. The construction of three new dreadnoughts (22,000 tons) for the Black Sea was begun in 1911—the *Emperor Alexander III.*, *Empress Marie*, and *Ekaterina*; their keels were laid October 30. Nine destroyers (1050 tons) and six submarines were also included in the programme for the Black Sea fleet.

The Russian navy bill, introduced in July by the minister of marine (Vice-Admiral Grigorovitch, appointed April 1, 1911), provides for the fixing of the naval strength according to a definite standard: For the Baltic fleet, 16 battleships, 8 armored and 16 other cruisers, 72 torpedo-boat destroyers, and 24 submarines, by 1924; the fleet in the Black Sea to be "half as strong again as any possible combination of fleets in those waters." The creation of a fleet in the Pacific being impracticable, only cruisers and torpedo craft will be maintained there. These projects had not in 1911 been ratified by the Duma.

The budget estimate (1911) for naval expenditure was 108,256,600 roubles; for 1912, 154,348,477. Additional sums were asked in 1912 for equipment of the admiralty shipbuilding yards, and other works. The number of men proposed for 1911 was 46,655; the number is fixed annually by law, and the men are recruited by conscription. See BATTLESHIPS and NAVAL PROGRESS.

GOVERNMENT. The emperor (1911) is Nicholas II. In him is vested the entire legislative, executive, and judicial powers. The Duma and the Council of the Empire have nominal legislative functions, and special administrative boards exercise executive functions. In 1911 the heads of departments were: Premier and Minister of Finance, V. N. Kokovtsoff; Minister of the Imperial Household, Gen. V. B. (Baron) Fredericksz; Foreign Affairs, S. Sazonoff; War,

Gen. V. A. Sukhomlinoff; Marine, Vice-Admiral I. K. Grigorovitch; Justice, J. G. Stcheglovitch; Interior, A. A. Makaroff; Commerce and Industry, S. I. Timacheff; Communications, S. V. Rukhloff; Procurator-General of the Holy Synod, V. K. Sabler; Agriculture, A. V. Krivocheyn; State Comptroller, P. A. Kharitonoff; Instruction, Dr. L. A. Casso. President of the Council of the Empire, M. G. Akimoff. President of the Duma, M. V. Rodsianko.

HISTORY

FOREIGN RELATIONS. The chief event in Russia's foreign relations during the year was the conclusion of the agreement with Germany concerning the Persian railways. See GERMANY, *History*, paragraph *Bagdad Railway*, and FRANCE, *History*. For other aspects of Russian foreign relations, see CHINA, *History*; UNITED STATES, *History*; and PERSIA, *History*.

M. STOLYPIN AND THE ZEMSTVO BILL. A serious constitutional difficulty arose in March. M. Stolypin had previously submitted to the Duma his project for the creation of separate electorates for Poles and Russians for the zemstvos of the southwestern (Polish) provinces, thereby establishing a local government system with a measure of self-government. It was a compromise measure which aimed to reconcile the interests of the Polish aristocracy with those of the Russians who make up the mass of population. It passed the Duma by a small majority, but when it came to the imperial council a vigorous opposition developed, comprising the members of all parties, and it was defeated by a large majority. Thereupon the premier presented his resignation to the czar, who, after trying in vain to prevail on M. Kokovtsoff to form the new ministry, recalled M. Stolypin to power on the latter's own terms, namely, the suspension from the council of his two opponents, General Trepoff and M. Durnovo, and the prorogation of the council and the Duma for four days, during which the law was promulgated by a simple decree under the emergency clause of the constitution. This arbitrary act caused great discontent in the Duma, where, in April, the leading orators vigorously denounced M. Stolypin. M. Guchkoff resigned the presidency of the Duma, and for a time a dissolution was threatened. M. Stolypin, at a crowded meeting of the Duma on May 10, denounced his critics, and after explaining the government's motives in applying the emergency clause of the constitution for the promulgation of the bill, declared that the government would not resort to the use of that clause in regard to any measure that had not been previously sanctioned by the Duma. He appealed to the Nationalist sentiment on behalf of the 10,000,000 Russians in the southwestern provinces, whose interests required the immediate passage of the bill. The Nationalist party was the only one that applauded his speech, the rest of the house receiving it with marked expressions of disapproval.

ASSASSINATION OF M. STOLYPIN. On September 14, while attending a performance at the theatre of Kiev, M. Stolypin, the Russian premier, was shot by a converted Jew named Bogroff. In the interval between the acts the premier was standing at the front row of the stalls, when the assassin advanced as if to speak to him. As M. Stolypin turned to address him

Photograph by Paul Thompson, N. Y.

PETER ARKADIEVITCH STOLYPIN
PREMIER OF RUSSIA, DIED SEPTEMBER 18, 1911

the man fired two shots in quick succession and ran from the house. The czar was in the imperial box when the tragedy occurred. The assassin was soon taken by the police, and his arrest was followed by that of his relatives and immediate friends. At the time of the crime Bogroff was a police agent, and it was said that he had told of a plot against M. Stolypin's life, and was, for that reason, placed among the officials who were to protect the theatre. M. Stolypin, after lingering a few days, died on September 18. The strong feeling against him among the revolutionaries and the more liberal element in Russian politics had increased during the last few months, though he retained the confidence of the czar. M. V. N. Kokovtsoff (q. v.) who had made an excellent record as minister of finance, succeeded him as premier. M. Makaroff succeeded to the portfolio of the ministry of the interior, which had been held by M. Stolypin.

OTHER EVENTS. On January 23 the government forbade students' meetings except for scientific purposes. During February disturbances in the universities caused the suspension of several courses of instruction. The police were blamed for their excesses on these occasions. In March the minister of education announced the determination to appeal to both professors and students to attend strictly to their classical and scientific studies. The rigorous treatment of the universities, resulting in the dismissal of several professors and the exile of numerous students and the introduction of the police into the universities, was severely criticized by the press and in the Duma. In February the Duma voted the financial means for the introduction of a system of elementary education. In spite of the refusal of the Duma to vote credits for the battleships until the naval administration had been reorganized, the budget committee proposed in February an annual instalment for the construction of four new battleships, but under conditions that limited the expenditure. The navy bill was published early in July. See above, *Navy*.

In June serious charges of corruption were brought against a number of public officials, and on July 17 sentence was rendered against several of them, together with certain members of a commercial house. An American squadron of four vessels visited St. Petersburg in June. In February the governor of Chernigov began to carry out a measure for a very extensive expulsion of Jews from the province. In March the rule for public schools, by which Jewish children might attend only at a ratio of 3 per cent. of the total attendance in cities, 5 per cent. in smaller towns, and 10 per cent. in the Jewish settlements, was extended by the ministry to private schools and to trade institutions. The Russian government's decision to incorporate the two maritime communes of the Viborg province in the St. Petersburg government caused great discontent throughout the whole province, and mass meetings were held in August and September to protest against it. The monk, Heliodorus, whose eccentric courses offended the Holy Synod, defied the latter's order for his removal, and, fortifying his church, held out against the authorities for two months. Finally, at the czar's request, the order for removal was withdrawn.

RUTGERS COLLEGE. An institution of higher learning at New Brunswick, N. J., founded in 1766. The number of students enrolled in the various departments of the college in 1911-12 was 500. The faculty and instructors numbered 55. During the year the faculty lost by death Edward B. Voorhees, professor of agriculture. Edward Luther Stevenson, professor of history, and Henry DuBois Mulford, professor of English, resigned. Their places were temporarily filled for the year 1911-12. A bequest of \$15,000 was received from V. M. W. Suydam, and another of the same amount from Miss Susan Y. Lansing was announced. Other gifts to the value of about \$25,000 were received. The productive funds amounted to \$700,000, and the income to about \$210,000. A chemistry building was completed during the year at a cost of \$66,000. As the State college of New Jersey it received during the year increase of support by the State for competitive scholarships. The library contains about 65,000 volumes. President W. H. S. Demarest, D. D.

RUTHERFORD'S THEORY. See PHYSICS.

RYAN, PATRICK JOHN. An American Roman Catholic archbishop, died February 11, 1911. He was born at Thurles, County Tipperary, Ireland, in 1831 and graduated from Carlow College in 1852. He was ordained as sub-deacon and shortly after came to the United States. He became professor of English literature at Carondelet Theological Seminary at St. Louis. He was ordained as priest in that city in 1853, becoming rector of the cathedral in 1856. During the Civil War he acted as chaplain at a military hospital in St. Louis. While rector of the Annunciation Church he delivered the Lenten lectures in English at Rome in 1868 on invitation of Pope Pius IX. He was consecrated in 1872 titular bishop of Tricomia in Palestine and made coadjutor-bishop of St. Louis. He was promoted to archbishop in 1883 and in the following year was transferred to the see of Philadelphia. In 1902 he was appointed by President Roosevelt a member of the board of Indian commissioners to succeed Bishop Whipple. He received the degree of LL. D. from Manhattan College, New York University, and the University of Pennsylvania. He was the author of *What Catholics Do Not Believe*, and the *Causes of Modern Religious Skepticism*.

RYE. The International Institute of Agriculture at Rome reports the total rye production in 1911 of 18 countries adhering to the institute at 1,550,560,000 bushels, as compared with 1,636,175,000 bushels in 1910. In comparison with 1910 the production in 1911 was considerably reduced in Russia, Rumania, Austria, and Hungary. The lower yields in these countries were due to a late and cold spring or to dry weather, and in some instances to both. Russia, the leading rye-producing country of the world, produced 762,109,000 bushels in 1911 and 867,626,000 bushels in 1910. These yields included 10,769,000 and 13,616,000 bushels of spring rye, respectively. Germany, which ranks second, produced 427,775,000 bushels in 1911 and 413,802,000 bushels in 1910, the area for the two years being 15,161,110 and 15,287,521 acres re-

spectively. Hungary, including Croatia and Slavonia, in 1911 produced 54,372,000 bushels, or about 99 per cent. of the crop of the previous year. The crop of Hungary proper was 96.3 per cent. of the crop of 1910, but in Croatia and Slavonia the production was 164.8 per cent. of the production of 1910. The Austrian crop of 1911 amounted to 103,155,000 bushels, which was 95.6 per cent. of the previous crop. France produced 48,156,000 bushels, or an increase of 9.6 per cent. over 1910. A more complete list of yields by countries is given under AGRICULTURE.

The rye crop of the United States in 1911 was about normal. The untoward weather conditions which injured most of the other crops affected rye and winter wheat but little, as these crops had largely matured when the drouth set in. The total production in 1911 was 33,119,000 bushels, and in 1910 34,897,000 bushels, the acreage for the two years being 2,127,000 and 2,185,000 acres respectively. The total value of the crop, based on the farm value on December 1, 1911, which was 83.2 cents per bushel, amounted to \$27,557,000, as compared with \$24,953,000 the year before. The leading rye States and their yields in 1911 were as follows: California 40,600,000 bushels, Minnesota 28,025,000 bushels, Wisconsin 20,010,000 bushels, North Dakota 20,475,000 bushels, Iowa 10,950,000 bushels, and Washington 6,512,000 bushels. The States leading in acreage were as follows: Minnesota 1,475,000 acres, California 1,450,000 acres, North Dakota 1,050,000 acres, and South Dakota 1,020,000 acres. The average yield for the entire country was 21 bushels per acre, as compared with 22.5 bushels in 1910 and 1909. The highest average yield for any State, 43 bushels per acre, was secured in Utah.

ST. ANDREW, BROTHERHOOD OF. An organization of the Protestant Episcopal Church, established for the spread of religious faith among young men. The brotherhood is divided into senior and junior departments. The active senior departments in 1911 numbered 947, and the junior departments 580. The brotherhood is active in the cause of personal evangelism, and is carrying on a general movement for the advancement of this cause. There were five secretaries in the field in 1911. Conferences were held in the South at Biloxi, Miss., in July, and at Seattle, Wash., in September. The national convention was held at Buffalo in October. The president of the brotherhood is Edward H. Bonsall, Philadelphia, and the general secretary is Hubert Carleton, D. C. L., Boston.

ST. BRANDON, or CARGADOS. A dependency of Mauritius (q. v.).

ST. HELENA. A British island in the South Atlantic. Area, 47 sq. miles; population (census of 1911), 3520. Jamestown (1416 inhabitants), the capital and port, is a British coaling station. Imports (1910), £37,570 (Great Britain, £33,781), against £29,303 (£28,059), in 1909; exports, £9234 (Great Britain, £8160) against £7892 (£1231) in 1909. Revenue (1910), £9306 (£8778 in 1909); expenditure, £9596 (£9045). Debt nil. Governor (1911), Capt. H. E. S. Cordeaux.

ST. KITTS, or ST. CHRISTOPHER. A British West Indian island; a dependency (with Nevis

and Anguilla) of the Leeward Islands. Area of St. Kitts, 65½ sq. miles; of Nevis, 50; of Anguilla, 35. Total area, 150½ sq. miles; total population, census of 1911, 43,303 (46,446 in 1901): St. Kitts, 27,733; Nevis, 12,495; Anguilla, 4075. Basseterre (8200 inhabitants in 1911) is the capital. Sugar-cane and cotton are the main crops; cattle are exported to near-by islands. The imports amounted in 1910 to £195,277, and the exports to £205,693. There are telegraph and telephone lines. Revenue (1910-11), £52,748; expenditure, £49,782. The debt stood, March 31, 1911, at £50,093. T. Laurence Roxburgh was administrator in 1911.

ST. LOUIS (Mo.). See MUNICIPAL GOVERNMENT, and BUILDINGS.

ST. LOUIS PUBLIC LIBRARY. See LIBRARY PROGRESS

ST. LUCIA. A British colony; an island of the Windward Islands (q. v.), having an area of 233 sq. miles, and a population (census of 1911) of 48,637. Castries, with (1911) 6266 inhabitants, is the capital. Exports of sugar in 1910, 5275 tons; of cacao, 1,637,400 lbs.; of rum, 4692 gallons. Value of total imports (1910), £277,208; of exports, £238,955. The revenue and expenditure for 1910-11 were estimated at £65,066 and £67,288 respectively. The debt stood at £146,930. E. J. Cameron was administrator in 1911.

ST. PIERRE and MIQUELON. A French colony, with other smaller islands off the southern coast of Newfoundland. The total area amounts to 93 sq. miles; population (1906), 6482. The only important industry is fishing. The imports amounted in 1909 to 5,167,000 francs; the exports, to 8,744,000. In 1909 1435 vessels, of 169,000 tons, entered. The local budget balanced in 1910 at 489,000 francs, and the debt stood January 1, 1910, at 439,000 francs. The office of administrator was vacant in 1911.

ST. THOMAS. See SÃO THOMÉ AND PRINCEIPE.

ST. VINCENT. A British colony; an island of the Windward Islands (q. v.), having an area of 140 sq. miles; population (census of 1911), 41,877. Births in 1910, 1687; marriages, 161; deaths, 831. About 13,800 persons are engaged in agriculture. Kingston, the capital, had (1911) 4300 inhabitants. Government primary schools, 8; mission, 19. Attendance (1909-10), 2222. Arrowroot, cassava, cacao, cotton, cereals, peanuts, and sugar-cane are grown; livestock is raised. Estimated acreage of cultivated land in the colony, 20,000. There are reported 25 sugar mills, 36 arrowroot mills, 2 cotton factories, and 5 distilleries. Imports and exports (1910-11), £97,737 and £101,180 respectively. There are no railways nor canals. The island is connected by telegraph with the other West Indian colonies, and has about 150 miles of telephone lines. Post offices (1909-10), 14. Revenue and expenditure for the year 1910-11, £30,125 and £30,343 (1909-10, £28,440 and £31,331). Public debt (March 31, 1910), £2050. Administrator (1911), C. Gideon Murray. Attached to St. Vincent are some of the Grenadine Islands.

SAKHALIN. An island, in part Russian, in part Japanese, off the eastern coast of Siberia. The Russian area is about 16,370 sq. miles, with about 12,000 inhabitants. It is governed by an administrator.

KARAFUTO, southern or Japanese Sakhalin. covers about 8800 sq. miles, and has about 26,000

inhabitants, of whom some 24,000 are Japanese. Forest products are important, and the fisheries are developing. The local budget balanced (1911-12) at 2,105,604 yen; ordinary revenue and expenditure were estimated at 1,151,947 and 1,011,072 yen, the deficit being covered by Japan. M. Hiraoka was administrative head in 1911.

SALEM. See NAVAL PROGRESS, *Propulsion*.

SALT LAKE CITY. See UTAH.

SALTUS MEDAL. See PAINTING.

SALVADOR. A Central American republic, on the Pacific coast. Capital, San Salvador.

AREA AND POPULATION. The area is estimated at 7225 sq. miles. The population, which is largely mestizo and Indian, is not definitely known, but a recent estimate places it at over 1,700,000. This figure is probably too high, but the country is, nevertheless, the most densely populated of the American republics. The larger towns include: San Salvador, with about 60,000 inhabitants; Santa Ana, 50,500; San Miguel, 25,000; Ahuachapán, 20,600; Chalchuapa, 20,400; Nueva San Salvador (Santa Tecla), 19,000; San Vicente, 20,400; Zacatecoluca, 20,000; Sonsonate, 18,000.

Primary schools, instruction in which is free and nominally compulsory, number about 600, with about 35,000 pupils enrolled and some 1100 teachers. There are over twenty higher schools.

PRODUCTION AND COMMERCE. The leading crop is coffee. Other important products of the soil are cacao, tobacco, indigo, rubber, balsam of Peru, sugar, and bananas. Mining, though largely confined to gold and silver, is growing in importance.

In 1909 and 1910 imports were valued at \$4,176,932 and \$3,745,249 respectively; exports, 16,963,575 and 18,244,590 pesos silver. With the gold premium at 150, the export values are converted to \$6,785,431 and \$7,297,836. Imports and exports in thousands of dollars (gold):

	1901	1905	1908	1909	1910
Imports	2,616	4,346	4,241	4,177	3,745
Exports	4,273	5,640	5,788	6,785	7,298

Leading imports in 1910: Cotton cloth and manufactures, \$1,091,246; flour, \$247,438; hardware, \$229,429; drugs and medicines, \$214,510; boots and shoes, \$174,888. The principal exports in 1909 and 1910 respectively were valued as follows (the silver peso being converted at 150): Coffee, \$4,590,705 and \$5,128,761; silver, \$412,329 and \$619,819; gold in bars, \$688,510 and \$601,319; indigo, \$257,246 and \$314,843; sugar, \$136,575 and \$292,755; balsam, \$103,681 and \$81,120. In 1910 the United States sent imports and received exports amounting to \$1,346,597 and \$2,279,669; Great Britain, \$1,165,993 and \$483,809; Germany, \$407,392 and \$1,584,632; France, \$262,294 and \$1,097,118; Italy, \$133,700 and \$609,674.

COMMUNICATIONS. At the end of 1910 there were in operation 156 kilometers (97 miles) of railway (narrow gauge). A line connects the port of Acajutla with San Salvador (105 kilometers), and a branch extends from Sitio del Niño to Santa Ana (40 kilometers). A line of 18 kilometers connects the capital with Santa Tecla. A railway is under construction between San Miguel and La Unión (62 kilometers). Telegraphs, 179 offices, with 2479 miles of line; post offices, 101.

FINANCE. The silver peso fluctuates in value,

being ordinarily worth about 40 cents. Ordinary revenue and expenditure have been as follows, in pesos:

	1908	1909	1910
Revenue	10,676,339	10,716,099	10,620,865
Expenditure	12,656,657	11,866,002	13,206,243

In 1910 extraordinary revenue was 2,630,761, making the total receipts 13,251,626 pesos. Of the ordinary revenue in 1910 import duties supplied 5,333,680 pesos; export duties, 866,650; liquor tax, 2,602,958. The larger branches of expenditure were: Public credit, 4,659,658 pesos; war and marine, 3,067,532; government, 1,937,948; fomento, 996,430; treasury, 590,818; charities, 508,350; justice, 498,929; public instruction, 492,174. The budget for 1911 showed a total estimated revenue of 13,129,750 pesos and expenditure 13,286,750 pesos. Public debt, December 31, 1910: External, 8,039,257 pesos gold; internal, 2,627,330 pesos silver; treasury bonds, 3,619,728 pesos silver.

ARMY. The army of Salvador is neither permanent in its numbers nor of sufficient training for active military operations. Its strength may be estimated at about 3000 men on a war footing, with about 18,000 militia in addition. In case of war all male inhabitants of the republic may be called upon for military service.

GOVERNMENT. The president is elected by popular vote for four years and is assisted by a cabinet of four members. The legislative power is vested in the unicameral National Assembly of forty members. Gen. Fernando Figueroa, who was inaugurated president March 1, 1907, was succeeded on March 1, 1911, by Manuel Enrique Araujo; vice-president, Onofre Durán.

SALVARSAN (ARSENO-BENZOL; 606). This new arsenic derivative discovered by Ehrlich and Hata was widely used during 1911 as a specific for syphilis. The wide advertising which this drug received and the remarkable properties attributed to it led to its somewhat reckless and indiscriminate use throughout both Europe and the United States. The earlier reports which were received led both the medical profession and the public to believe that a single dose would effect a cure, that it completely destroys the infection and eradicates the disease. The new drug was to be a *therapia sterilans magna*, in Ehrlich's phrase, which would destroy by one massive dose all of the spirochetæ in the syphilitic patient. This hope has been far from realized. Not only has a single dose of the drug failed to cure, but the evidence is increasing that it does not permanently or completely cure any case. Nevertheless, in severe and intractable cases where the ordinary treatment has proved ineffective, salvarsan has shown a remarkable effect. The general opinion seems to be that the drug should be reserved for such cases, and that the ordinary well-tried methods should be adhered to as a rule. This opinion is strengthened by reports of the untoward effects of salvarsan in numerous instances. The drug appears to exercise a selective action upon the nervous system, as might be expected of an arsenic compound. Besides many deaths which occurred after the use of the drug, a large number of unpleasant complications have been reported, and there is, moreover, good ground for the belief that a

larger proportion of serious accidents have occurred than would be estimated from the present literature. Atrophy of the optic nerve, deafness, and other auditory disturbances, due to inflammation of the internal ear, were reported quite frequently. Hausmann reported thrombosis of the veins after an intravenous injection of salvarsan. Mohr reported three cases of serious injury to the kidneys under salvarsan medication, and in one case severe collapse and diarrhoea followed intravenous infusion, with other symptoms of arsenic intoxication and damage of the kidney, such as would be found from a systemic poison. Similar cases were reported by Jerome, Jadassohn, Scholz, and others. The drug is given either by intramuscular injections or by direct infusion into a vein (usually of the arm) which has been opened for the purpose.

SALVATION ARMY. A religious body, founded on military principles by William Booth in 1878, although as a Christian mission it had existed in London since 1865.

The United States is divided into two departments, with the national headquarters in New York City. Miss Evangeline Booth is in charge, with Col. William Pearl as chief secretary. The department of the West administers the affairs of the Western States, with headquarters in Chicago. Commissioner Thomas Estill is in charge, with Col. George French as territorial secretary.

The following figures cover the work for the year ending September 30, 1911, in the United States only. The corps and outposts number 870. The indoor attendance at meetings was 7,814,741. The local officers and bandmen number 7010. There were 55,866 junior meetings held, with an attendance of 1,598,433. The relief institutions for the poor include 112 industrial homes, to which 16,196 men were admitted; 83 workmen's hotels, with shelter accommodations for 6792; 19 slum posts, by which 1859 sick cases and 23,859 families were visited; 28 rescue homes, to which 1702 girls and 1174 children were admitted; a bureau for missing friends, through which 211 persons were found. The Salvation Army distributed 18,600 Thanksgiving dinners and 333,742 Christmas dinners (1910); afforded temporary relief to persons outside industrial homes and hotels numbering 209,548. Summer outings were given to 6161 mothers and 27,832 children. There were distributed 2,303,710 pounds of ice and 5,014,681 pounds of coal.

SAMOS. An Anatolian island; a principality tributary to the Porte. It has an area of 181 sq. miles, and a population of 53,424, besides 15,000 residents on the Anatolian shore. The capital is Vathy, with 25,000 inhabitants. The principal products are wine, raisins, olive oil, and tobacco. The imports were valued in 1910 at 28,379,838 piasters, and the exports at 22,138,226 (9,000,000 piasters wine, 2,124,000 cigarettes). The budget for 1910 estimated the revenue at 3,651,660 piasters, and the expenditure at 3,627,496. Public debt, 2,570,500 piasters. Andreas Kopassis Effendi was prince-governor in 1911.

SANATORIA. See TUBERCULOSIS.

SAND-FLY. See PELLAĞRA.

SANDS, JAMES HOBAN. A rear-admiral, retired of the United States navy, died October 27, 1911. He was born in Washington in 1845 and graduated from the United States Naval Academy in 1863. He was made ensign in the same

year and served throughout the Civil War, rising to the rank of master. He served in the North Atlantic blockading squadron in 1863-5 and participated in the evacuation of Charleston and the attacks on Fort Fisher. In 1866 he was made lieutenant and in 1868 lieutenant-commander. He was on duty at the Naval Observatory from 1868 to 1870. He was promoted to be commander in 1880, captain in 1894, and rear-admiral in 1902. In 1902-3 he was commandant at the navy yard at League Island. From 1903 to 1905 he commanded the coast squadron of the North Atlantic fleet and from 1905 to 1907 he was superintendent of the United States Naval Academy. In the latter year he was retired.

SAN FRANCISCO. See MUNICIPAL OWNERSHIP.

SANI-ED-DOWLEH, Persian minister of finance, assassinated February 4, 1911. He had occupied many positions in the government of Persia, among them minister of commerce, minister of the interior, and minister of education. He was also president of the first Persian parliament. He was arrested in December, 1907, after a quarrel with the shah, who was afterwards dethroned. He was released, however, the day following, through the good offices of the British minister. He fled to the Italian legation. When the disorder arose that ended in the dethronement of the shah, he resumed his cabinet duties as minister of education under the new shah. In 1910 he became minister of finance. His murderers were supposed to have been Georgians.

SANITARY MILK. See DAIRYING.

SANITATION. Recent advances in sanitation include measures to obtain purer water and milk supplies, the extension of sewerage systems, and the abolition of privy vaults and cesspools, better systems of sewage disposal, the proper collection and disposal of garbage and other city refuse, more efficient street cleaning, the amelioration of housing and factory conditions, improved means of ventilation, the reduction of flies and mosquitoes, the prevention of spitting on floors and street surfaces, and the abolition of the common towel and drinking cup. Aside from pure water supplies, most of these activities may be classed under the general head of municipal and private cleansing and should be clearly differentiated from the classes of health-protective work which are, or should be, the chief function of boards of health. It is to be expected, however, that local and State boards will assume more or less general supervision over municipal cleansing in the interests of sanitary efficiency and for the safeguarding of the public health at such vital points as may be involved. The relation between such cleansing and sanitary operations and boards of health was forcibly discussed in an address by E. O. Jordan in 1911 (published later in the *Journal of Infectious Diseases*, Chicago) entitled, "Profitable and Fruitless Lines of Endeavor in Public Health Work"; also, in an article on "The Relative Values of Different Public Health Procedures," by Mr. H. W. Hill, published in the *Engineering News*, New York, October 12, 1911.

WATER POLLUTION. The National Associa-

THE PHILADELPHIA PURE MILK EXHIBITION OF 1911

tion for the Prevention of the Pollution of Rivers and Waterways effected a permanent organization at Baltimore, Md., in December, 1911, and appointed a committee on standards of purity. The consensus of opinion was that the campaign against water pollution ought to be conducted on a rational, rather than a sentimental, basis, with due regard to all the conflicting interests, and to the various practical and economic limitations of the subject. Public and private agencies have been studying the pollution of the Ohio River, Lake Michigan, and Lake Erie. The United States Public Health and Marine Hospital Service, as Part I. of *Sewage Pollution of Interstate and International Waters*, has published a report on Lake Erie and the Niagara River. The same federal agency also published, in 1911, a fourth report on the "Origin and Prevalence of Typhoid Fever in the District of Columbia," which still further exonerates the filtered public water supply, and places the chief blame for typhoid on infected milk, contact with typhoid patients, and typhoid carriers.

MILK SUPPLIES. Within the past few years there has been a great awakening to the danger from milk infection at its source, in transit from country to city, and while being distributed to consumers. To lessen this danger stringent milk ordinances have been passed by many cities, milk inspection in country and city established, and bacterial and physical tests of milk made. The New York Milk Committee is studying measures for the control of milk supplies. A "Milk Show" was held at Philadelphia in 1911, under the auspices of the bureau of municipal research of that city. The bureau has published an illustrated report on the show, and the New York Milk Committee has also published, under the title, "Milk Problems," the proceedings of a conference held under its auspices. The part played by the milk supply of the District of Columbia in spreading typhoid there is stated in some detail in the report already mentioned. The board of health of Montclair, N. J., won a victory in the State Supreme Court of New Jersey in its long struggle to uphold the portion of its sanitary code which provides that no milk shall be sold in the town except from cows which have been proven by the tuberculin test to be free from tuberculosis. The case was appealed, but just before it came to trial on appeal in November, 1911, the contesting milk company agreed to supply only milk from tuberculin-tested cows or else milk which had been pasteurized. The British Royal Commission on Human and Animal Tuberculosis published its final report in 1911 (London). The commission was appointed in 1901 and issued interim reports in 1904, 1907, and 1909. Of the various conclusions of the series of reports the ones that are pertinent here are that cow's milk conveys tuberculosis to human beings, chiefly, but not wholly, to infants and children; and particularly abdominal and cervical gland tuberculosis in children; that the infection may be from the feces and urine of the cows as well as from diseased udders; and that strong measures should be taken to prevent the use of infected milk. See DAIRYING.

See also GARBAGE AND REFUSE DISPOSAL; SEWAGE PURIFICATION; SMOKE PREVENTION; and WATER PURIFICATION.

SANITATION OF SOILS. See SOILS.

SANTO DOMINGO, or more properly, THE DOMINICAN REPUBLIC. A republic occupying

the eastern part of the island of Haiti. Capital, Santo Domingo.

AREA AND POPULATION. The estimated area is 18,045 sq. miles, and the estimated population upwards of 600,000, mostly of mixed Spanish and negro origin. According to one estimate, the inhabitants at the end of 1908 numbered 673,611. The principal towns are: Santo Domingo, with 20,000 inhabitants; Puerto Plata, 17,500; Macoris, 15,000; Santiago, 12,000. In 1910 there were 526 public schools (against 481 in 1909), with 18,812 pupils.

PRODUCTION AND COMMERCE. The people are engaged largely in agriculture, but there are no statistics of production. The principal crops are sugar, tobacco, coffee, and bananas. There is a considerable production of honey, and cattle-raising is important. Various minerals occur, but mining is not developed.

According to the general receivership of customs, imports and exports have been valued as follows:

	1908	1909	1910
Imports	\$4,767,775	\$4,425,913	\$6,408,838
Exports	\$3,398,487	\$1,113,690	10,849,623

Leading imports in 1910: Cotton manufactures, \$1,481,344; iron and steel, \$863,334; rice, \$497,046; meat and dairy products, \$416,291; wheat flour, \$410,705; oils, \$337,550; leather and manufactures, \$208,587. Principal exports in 1910: Raw sugar, \$5,590,536 (against \$3,304,931 in 1909); cacao, \$2,849,585 (\$2,750,191 in 1909 and \$4,269,047 in 1908); leaf tobacco, \$958,441; coffee, \$323,749; bananas, \$288,647; wax, \$148,804; cattle hides, \$123,732; goat-skins, \$86,084. Trade with principal countries, in thousands of dollars:

	Imports		Exports	
	1909	1910	1909	1910
United States	2,374	3,885	4,709	7,661
France	189	227	924	724
Germany	912	1,108	2,182	2,094
Great Britain	577	709	77	142

COMMUNICATIONS. Railways in operation have a reported length of 232 kilometers (175 miles); in addition, private lines for the larger sugar plantations aggregate about 362 kilometers (225 miles). Puerto Plata is connected by rail with Santiago and Moca, and Sanchez with La Vega; a branch connects Macoris with Jina, and Salcedo with Cabullas. Telegraphs (1909): 52 offices, with 2044 kilometers (1270 miles) of line; of this 1444 kilometers were state owned and in 1910 were increased by 212 kilometers. Post offices, 81.

FINANCE. In 1909 revenue and expenditure amounted to \$4,523,160 and \$4,532,323 respectively; in 1910, \$4,705,738 and \$4,645,287. Of the revenue in 1910, \$3,121,642 was derived from customs. The budget for the fiscal year 1912 showed estimated revenue of \$4,250,000 and estimated expenditure of \$4,256,804. An American-Dominican treaty authorized a loan of \$20,000,000 for the conversion of the debt and established an American receivership of customs, from April 1, 1905. The reorganization of Dominican finance has proceeded satisfactorily, all obligations being met promptly.

GOVERNMENT. The executive authority is vested in a president elected indirectly for six years and assisted by a cabinet of seven mem-

bers. There is no vice-president, and under the constitution (April 1, 1908), the successor of a president dying or incapacitated in office is chosen by the Congress. This body consists of the Senate (12 members) and the Chamber of Deputies (24). Gen Ramón Cáceres was installed in 1906 to complete his predecessor's term and was inaugurated for a full term on July 1, 1908. On November 19, 1911, Cáceres was shot and killed by an assassin, and on December 2 Senator Eladio Victoria was elected provisional president.

In 1911 a boundary dispute with Haiti was submitted to the Hague Tribunal.

SÃO THOMÉ AND PRINCEPE. A Portuguese colony composed of two islands off the coast of French Equatorial Africa. Area, about 360 sq. miles; population, 1909, 68,221 (42,103 in 1900, of whom 40,639 negroes). A large part of the world's supply of cacao comes from these islands. Other products and exports are coffee, rubber, and cinchona. The imports in 1909 were valued at 2,560,587 milreis, the exports at 3,240,984. In 1909, 231 vessels, of 584,000 tons entered. São Thomé has a nine-mile railway building. The revenue and expenditure for 1909-10 were estimated at 931,429 and 703,315 milreis respectively. The governorship in 1911 was vacant.

HISTORY. The conditions of labor on the cacao plantations of São Thomé and Príncipe, whence comes about one-fifth of the world's supply of cacao, have been the subject of serious complaints in recent years. Mr. J. Burt, in a report to the British Foreign Office, published in 1908, drew attention to the practice of importing laborers, saying that thousands were brought from other regions, especially from Angola, and forced to labor on the islands, and no effort was made to repatriate. Mr. Cadbury, the British cocoa manufacturer, after a visit to the islands, as a representative of a commission of the British trade, corroborated the charges, and after the publication of his report in 1909, British and American manufacturers resolved not to purchase cacao in that market unless the abuses were removed. The Portuguese government listened to these complaints, and in July, 1909, issued regulations, limiting the zones within which native labor might be recruited, limiting the number of laborers that should be engaged, providing that recruiting could be carried on only by licensed agents, and introducing other measures of reform, which, it was believed, would be effective, if conscientiously carried out. As to repatriation, laborers who had served their time were to be shipped free to the proper port on the African coast at four fixed repatriation periods in each year. Half of the laborer's wages were to be retained by the government and given him on his return to the mainland.

In January, 1911, at the request of the planters, the Portuguese minister of marine and colonies decided that henceforth labor should not be recruited from Angola, but from Portuguese Guinea. There was difficulty during the year over the question of repatriation. The planters of São Thomé and Príncipe objected to the decree of the government concerning the repatriation of native laborers. A group comprising the chief planters of the colony petitioned the government to suspend the decree which required the repatriation of all native laborers at the expiration of their contracts. In answer to this appeal the minister of marine and col-

onies gave the natives who did not care to be repatriated the right to enter into new contracts. It was announced that precautions would be taken against any coercion at the time of re-engagement and that recruiting should take place under government agents, who would make sure that only those natives should be accepted who were willing to make contracts. At the close of the year negotiations were in progress for the sale of the yearly production of the São Thomé and Príncipe plantations to a group of British capitalists.

SARAWAK. A British protectorate covering approximately 50,000 sq. miles, on the west coast of Borneo. Population (estimate), 500,000. Kuching is the capital. Great quantities of coal are present, besides precious metals and diamonds. Sago, rubber, rice, rattans, pepper, and gambier are produced for export. Imports in 1910 were valued at 7,811,556 dollars Mexican; exports, at 8,098,142 (export of gold, 951,119). The revenue and expenditure were estimated in 1910 at 1,407,359 and 1,263,062 dollars respectively. Sir Charles Johnson Brooke was rajah in 1911. The heir-apparent, Charles Vyner Brooke (born September 26, 1874), was married in 1911 to Hon. Sylvia Brett.

SARDIS. See ARCHEOLOGY.

SASKATCHEWAN. A province (since September 1, 1905) of the Dominion of Canada. Area, 250,660 sq. miles. Population, according to the final returns of the census of June 1, 1911, 492,432, as compared with 91,279 in 1901, the increase being 401,153, or 439.48 per cent. Capital, Regina, with (1911 preliminary) 30,210 inhabitants. The province is administered by a lieutenant-governor (in 1911, appointed October 5, 1910, George William Brown), appointed by the governor-general of Canada. He is aided by an executive council (responsible ministry) and a unicameral legislative assembly of 41 elected members. Walter Scott was premier in 1911. See CANADA.

SAVINGS BANKS. American savings banks are of two classes, the mutual savings banks, operated for the benefit of both shareholder and depositor, and the stock savings bank, operated primarily for profit and transacting both a savings and a commercial business. Nearly all mutual savings banks are located in the New England and Eastern States; out of a total of 635 such banks, only 21 are found in other States. Stock savings banks are operated in nearly every State of the Union, but are much more numerous in the Middle Western States than elsewhere. Of a total of 1884 savings banks in the United States in 1911, 421 were found in New England, with 3,394,000 depositors and \$1,372,883,000 of deposits; of these 192, with 2,139,000 depositors and \$791,931,000 deposits were credited to Massachusetts. There were 242 savings banks in the Eastern States, with 4,119,000 depositors, and \$1,981,000,000 deposits; of these, 141, with 1,957,000 depositors and \$1,561,000,000 deposits, were in New York State. There were 197 savings banks in the Southern States, with 367,800 depositors and \$93,614,000 of deposits. In the Middle Western States there were 816 such banks, with 1,064,000 depositors and \$358,600,000 deposits; of these, 697, with nearly one-half of the depositors and deposits, were in Iowa. There were only 54 savings banks in the Western States and 154 in the Pacific States. Of the latter, 123 were in Cali-

INTERESTING MODELS TO SHOW GOOD AND BAD CONDITIONS OF DAIRYING
THE PHILADELPHIA PURE MILK EXHIBITION OF 1911

ifornia. The reports of the comptroller of the currency states that the growth of such banks in California is the most remarkable feature of recent progress. The number of depositors in savings banks in that State increased by 267,996, and the amount of deposits increased by \$28,000,000. The growth of savings institutions in the past ten years has been remarkable. In 1901 there were 1007 savings banks with 6,358,000 depositors and \$2,597,000,000 deposits, whereas the 1884 banks of 1911 had 9,794,000 depositors and \$4,212,000,000 of deposits. Moreover, the average deposits increased from \$408 to \$430 in 1911. This average, however, was \$15 less in 1911 than in 1910.

The mutual savings banks are immensely more important as savings institutions than the stock savings banks. Thus, on June 7, 1911, they showed resources of \$3,762,000,000. Their loans and mortgages aggregated \$1,809,000,000, of which about 90 per cent. was secured by real estate and mortgages owned. They also had \$1,715,000,000 invested in stocks and bonds; of this, about 44 per cent. was in State, county, and municipal bonds, and 45.5 per cent. in railroad bonds, the greater part of the remainder being in the bonds of other public service corporations. The deposits of the mutual savings banks aggregated \$3,460,000,000, a gain of \$100,000,000 during the year. More than 45 per cent. of these deposits were held by the 141 mutual savings banks in New York State. The depositors numbered 7,691,000, a gain of 209,000 during the year. Of these, 2,957,000 were in New York banks and 2,139,000 in Massachusetts banks. Connecticut banks came third with 587,000 depositors. The average rate of interest paid by these banks ranged from 3.7 per cent. in the Eastern States to 4 per cent. in the Western States, the average of all being 3.95 per cent.

Of the 1249 stock savings banks only 49 were in new England and the Eastern States, 196 were in the Southern States, 797 in the Middle Western States, 54 in the Western States, and 153 in the Pacific States; 697 of them were in Iowa and 122 in California. The loans of these banks aggregated \$605,000,000, and their investments in bonds and securities \$133,752,000. They had 2,103,000 depositors, of whom 1,740,000 were savings depositors. Their deposits amounted to \$752,000,000, of which \$176,000,000 was subject to check. The average interest rate which they paid ranged from 3.17 per cent. in Kentucky to 4.2 per cent. in Georgia.

The table on page 626, from the annual report of the comptroller of the currency, gives the latest available data on savings banks throughout the world. This table includes statistics for all savings banks, including postal. For a separate table on the latter see POSTAL SAVINGS BANKS.

SAVINGS BANKS, POSTAL. See POSTAL SAVINGS BANKS.

SCHENECTADY (N. Y.). See MUNICIPAL GOVERNMENT.

SCHLEY, WINFIELD SCOTT. A rear-admiral in the United States navy, retired, died October 2, 1911. He was born near Frederick City, Md., in 1839. He was appointed to the United States Naval Academy in 1856, graduating in 1860. He was assigned as midshipman to the steam frigate *Niagara*, which cruised in Asiatic waters and then around the Cape of Good Hope. The vessel returned to the

United States just at the outbreak of the Civil War. Schley was assigned to the gunboat *Owasco*, which was attached to the Gulf squadron. He saw considerable service in operations on the Mississippi River, taking part in the engagements which led to the capture of Port Hudson, La. In 1862 he was promoted to the rank of lieutenant and in the following year was on duty with the western Gulf blockading squadron. From 1864 to 1866 he served in the Pacific squadron. He was on duty at the United States Naval Academy from 1866 to 1869. In 1871 he participated in the attack on the Salée river forts in Korea. In 1872 he again returned to the Naval Academy, serving until 1876. In the latter year he was promoted to be commander and from 1876 to 1879 he commanded the *Essex*. From 1880 to 1883 he was lighthouse inspector of the second district. He came prominently before the public in 1884 as commander of the expedition sent to the Arctic regions to rescue Lieutenant Greely and the survivors of his expedition. This he succeeded in accomplishing and he was rewarded for this service by a gold medal from Congress. Further recognition was given by President Arthur, who placed him in charge of the bureau of equipment and recruiting. He was made a captain and remained as chief of this bureau until 1889. For three years succeeding he commanded the *Baltimore* and in 1891 sailors from this ship were attacked in the streets of Valparaiso by Chileans, and some of them were killed. The *Baltimore* was threatened by Chilean battleships and Captain Schley made preparations to fight. The Chilean ships, however, did not appear. While in command of the *Baltimore* he took the body of John Ericsson, the inventor, to Sweden and received a gold medal from the king of Sweden. In 1896-7 he was a member of the Board of Inspection and Survey and in the following year he was chairman of the Lighthouse Board. In 1898 he was commissioned commodore and put in command of the North Atlantic squadron. He was promoted rear-admiral March 3, 1899, and was retired October 3, 1901. At the outbreak of the Spanish-American War in 1898 he was placed in command of the *Brooklyn*. He was second in command of the squadron which, under Captain (acting Rear-Admiral) Sampson, blockaded the port of Santiago, where the Spanish fleet had taken refuge. After the battle of Santiago a bitter controversy arose among the partisans of Sampson and Schley as to who was in command at the battle of Santiago. Admiral Sampson was on his flagship, the *New York*, when Admiral Cervera, in command of the Spanish fleet, attempted to escape from the harbor of Santiago on July 3, 1898. Admiral Sampson had started for Siboney, several miles away, to confer with General Shafter. Admiral Schley was outside of Santiago harbor with his flagship, the *Brooklyn*. The partisans of Admiral Schley claimed that he was in active command at the time the Spanish vessels issued from the harbor and that to him therefore was due chiefly the credit of the American victory. The supporters of Admiral Sampson claimed that while the latter was absent at the beginning of the battle, his flagship, the *New York*, turned about at the first appearance of the Spanish fleet and arrived in time to take active part before its close. They claimed that the plans which re-

sulted in the destruction of the fleet were those of Admiral Sampson. During the battle the *Brooklyn* made a manœuvre which afterwards became famous as "the loop." The friends of Admiral Schley contended that this was an excellent piece of naval strategy, while the partisans of Admiral Sampson claimed that by the manœuvre he had endangered the other vessels of the squadron. The movements made by Schley a few weeks before were also criticised, and this controversy continued for three years with ever-increasing bitterness. Admiral Schley then demanded a court of inquiry. This court consisted of Admiral George Dewey, chairman, and Rear-Admirals A. E. K. Benham and F. M. Ramsay. The court held that his conduct had been characterized by vacillation, dilatoriness, and a lack of enterprise, condemning him on all the points in question, but declaring that he was self-possessed during the battle and encouraged the men by his example. It held that the "loop" manœuvre was made to keep the *Brooklyn* from approaching too close to the Spanish ships and that it endangered the other vessels of the squadron. Admiral Dewey dissented from the decision in certain minor specifications. The court made no general decision in regard to the command at Santiago, but Admiral Dewey made a second report in which he stated that he regarded Admiral Schley as the commander-in-chief at the Santiago battle. Admiral Schley appealed from this decision of the court, but the appeal was denied. At the close of the Spanish War he was made commander-in-chief of the South Atlantic squadron, 1899. He held this position until he retired in 1901. He was the author of *The Rescue of Greely* (1885) and *Forty-five Years under the Flag* (1904).

SCHMUCKER, SAMUEL D. An American jurist, died March 3, 1911. He was born at Gettysburg, Pa., in 1848 and graduated from Pennsylvania College in 1873. He served in the Civil War and after its close studied law at New York University. He practiced in Baltimore from 1865 to 1898 and in the latter year was appointed judge of the court of appeals of the State. He was one of the commissioners who prepared the present charter of Baltimore.

SCHWAB, LAWRENCE HENRY. An American Protestant Episcopal clergyman, died May 28, 1911. He was born in 1858. At the time of his death he was canon of the Cathedral of St. John the Divine in New York City. He wrote *The Kingdom of God*, which comprised the ten Bohlen lectures of 1897, and translations and condensations of Nippold's *History of the Papacy*. For some months before his death

he was engaged on a biography of the late Bishop Henry C. Potter.

SCHWEITZER, JOHANN PAUL. A German-American chemist, died in August, 1911. He was born in Berlin in 1840 and studied at the University of Göttingen, receiving his degree in 1869. Previous to that time he had acted as chemical assistant and instructor in Berlin and in the School of Mines at Columbia University. He served from 1872 as professor of agricultural chemistry, and from 1894 as chemist to the agricultural experiment station, University of Missouri, until he retired from active duties in 1906. He was the author of many papers on chemical subjects in scientific journals.

SCOTT, R. F. See POLAR RESEARCH.

SCUDDER, SAMUEL HUBBARD. An American naturalist, died May 17, 1911. He was born in Boston in 1837 and graduated from Williams College in 1857. He later studied at the Lawrence Scientific School. For two years he acted as assistant to Louis Agassiz. From 1862 to 1870 he was secretary of the Boston Society of Natural History and for the greater part of this period was its custodian. He was president of this society from 1880 to 1887. He was assistant librarian of Harvard University from 1879 to 1882. From 1886 to 1892 he was paleontologist of the United States Geological Survey. He was a member of the National Academy of Science from 1877 and an honorary member of Russian, Spanish, German, British, and other foreign scientific societies. He wrote extensively on subjects connected with natural history, especially butterflies. His best known works are: *A Century of Orthoptera* (1879); *Butterflies, their Structure, Changes and Life Histories* (1881); *Butterflies of the Eastern United States and Canada* (1889); *The Fossil Insects of North America* (1890); *Index to the Known Fossil Insects of the World* (1891); *The Life of a Butterfly* (1893); *Everyday Butterflies* (1899); *Catalogue of the Described Orthoptera of the United States and Canada* (1900); and *Index to North American Orthoptera, Described in the 18th and 19th Centuries* (1901).

SCULPTURE. There was little sculpture of importance at either of the exhibitions of the New York National Academy of Design in 1911. In the spring show R. Hinton Perry had a graceful dancing figure entitled, "Thamara," and J. Scott Hartley two delightful children. Lindsey M. Sterling showed "The Awakening," a good study of a little girl. Robert T. Aiken had a portrait of Henry Arthur Jones, the playwright; and John Flanagan, a well-modeled head of E. G. Kennedy. A vigorous equestrian Indian figure, "Appeal to the Great Spirit," by Cyrus E. Dallin, stood at the entrance of the winter exhibition. Daniel C. French had an exquisite head of a young girl, and Edith W. Burroughs was successful with a portrait of Mrs. Edward Robinson. Furio Piccirilli's nude "Eurydice" had its good points, and Miss Gertrude V. Whitney's head of a Spanish peasant had some strength.

Several monuments were unveiled in the United States. At Lehigh University a bronze mural tablet by James Massey Rhind to the memory of Judge Asa Packer, founder of the university, brought the sculptor much commendation. A life-size bronze figure of Robert G. Ingersoll, by Fritz Triebel, was erected

in Peoria, Ill., the birthplace of the late free-thinker and lecturer. A memorial statue of William Cullen Bryant, by Herbert Adams, was unveiled in New York. A colossal concrete statue of Blackhawk, by Lorado Taft, upon a bluff overlooking the Rock River in Illinois, has grim power. Alexander Doyle's statue of Edwin M. Stanton was unveiled in Steubenville, O., in September. An heroic group of figures bearing immense burdens, by Louis Potter, was exhibited at the Child-Welfare exhibition held in New York.

FOREIGN. Some sculpture of importance was shown at the Paris Salon of the Artistes Français, the most conspicuous place being awarded to Boreau's monument to the artist José Frappa. Bouchard had a monument to the victims of the "République" disaster. Another reminder of recent disasters was Royer Bloche's composition showing a falling aeroplane. Busts of the two Coquelins and of Molière, by Agustin Maillard, were intended for the Théâtre Français. Among the American exhibitors were C. E. Dallin, whose Indian on horseback was seen later at the winter show of the New York Academy of Design; John Boyle, Huxley Daggett, and William H. Dietrich.

An imposing monument in memory of the French Revolution by Sicard, was placed in the Paris Panthéon, and there was dedicated in the church of the Madeleine a votive statue of Joan of Arc by Raoul Larche, representing the maid grasping her sword.

The most important work unveiled in England was the great memorial to Queen Victoria opposite Buckingham Palace in London, upon which Sir Thomas Brock has been working for nearly ten years. An immense double fountain is approached by flights of steps flanked by pedestals surmounted by lions and by groups representing peace, progress, manufactures, and agriculture. Over the fountains are colossal figures symbolizing bravery and intelligence. Around a huge column are the chief statues and groups, with, beneath them, ships' prows. The marble statue of Queen Victoria, in robes of state, with orb and sceptre, is on one side, with figures representing motherhood, justice, and truth on the other sides. The whole monument is surmounted by a gilded bronze Victory. At the Royal Academy show Sir George Frampton's "Peter Pan," busts of King George and Queen Mary by Drury, and a statuette of Mrs. Ridpath by Reynolds-Stephen attracted favorable notice.

A young Polish sculptor, Elie Nadelman, born in Warsaw in 1882, gave an exhibition in Berlin of work that many critics praised as comparable only to Greek art. An ideal classic head, "La Mystérieuse," was singled out for particular praise. In Budapest a memorial to the artist Munkácsy was unveiled. A woman holding aloft a wreath stands by a stone shaft. It is the work of Eduard Telcs.

During the year occurred the death of Thomas Ball (q. v.), who was in his ninety-third year. He will be best remembered for his equestrian statue of Washington and his Lincoln Emancipation group, both in Washington, D. C., and his statue of Daniel Webster in New York.

SEEBACH, WILHELMINE. A German actress, died in May, 1911. She was born in 1833, a sister of the more famous Marie Seebach. She began professional life as a singer, making her first appearance as Annechen in *Der Freischütz* at the Stadt Theater in Hamburg. She soon abandoned opera for the drama and played engagements in various German cities. She earned the title of court actress and ended her active career as a member of the theatre at Königsberg. After the death of her sister, Marie, she devoted herself to the management and development of the various charities for her profession which Marie had founded or planned. These included the Seebach Home in Weimar and the refuge for the children of actors in Berlin.

SENEGAL. A colony (the oldest) in French West Africa (q. v.), with an area of 196,720 sq. kilometers and a population (estimate) of 1,209,719. St. Louis, the capital, had 23,045 inhabitants in 1909; Dakar, 18,718. Imports (1909), 67,912,239 francs; exports, 59,164,917 (peanuts, 43,829,459; rubber, 7,700,580; gum arabic, 1,531,911; live animals, 323,548). Railways, 819 kilometers. Revenue and ex-francs for the colony; 5,052,148 and 4,356,086 for the protectorate. Lieutenant-governor (under the direction of the governor-general of French West Africa) in 1911, J. Peuvergne.

SERUM SICKNESS. See ANAPHYLAXIS.

SERUM THERAPY. During the past few years the development of specific serums has to some extent languished, on account of the increased employment of vaccines or dead cultures of bacteria in combating infections of the human body, vaccines being comparatively easy to prepare, more adaptable, and less expensive. A number of new discoveries have, however, been made with regard to the curative properties of normal serum, human or animal, when injected. Not the least important of these is the remarkable control over hemorrhage which normal human serum, or horse serum, or even diphtheria antitoxin, exerts when injected into a "bleeder." Not only are hemophiliacs (congenital "bleeders") thus influenced; hemorrhage following operations, severe nosebleed, and particularly secondary hemorrhages after operations on the tonsils, have been stopped after one or two injections of serum, horse serum preferably, according to the general opinion. Horse serum has been found to have a decided bactericidal power. Fejes found that the bactericidal action of fresh normal animal blood serum in the test-tube is present also

"WILLIAM CULLEN BRYANT"

HERBERT ADAMS, SCULPTOR. UNVEILED IN BRYANT PARK, NEW YORK CITY, 1911

when the serum is brought into contact with an infectious focus in the tissue. Gergo used normal horse or cattle serum in treating abscesses. He first aspirated the pus, then injected a little serum into the abscess cavity to rinse it out, aspirating all excessive fluid, and covered the puncture hole with a sterile dressing. He states that a single treatment was generally sufficient, and it seemed to be immaterial what germs were involved or where the abscess was located. The functional and cosmetic results were better than those obtained by incision and drainage. The bactericidal serum also seemed to induce a passive immunization, with an increase in the leucocytosis and phagocytosis. Care must be taken to aspirate the superfluous serum.

An illustration of another phase of serum therapy is furnished by a case reported by Mayer and Linser, who treated a woman suffering from recurrent herpes due to pregnancy. The entire body was covered with a purulent eruption. After failure of all other measures, at the end of two weeks, 10 c. c. of normal serum from another woman was injected into the patient to test the tolerance for normal human serum. Three days later 10 c. c. of serum from a healthy pregnant woman was injected, and three days later 20 c. c. from another healthy pregnant woman. The temperature began to subside after the second injection and became normal after the third, the eruption drying up and disappearing. Five weeks afterward the same eruption recurred but in less pronounced form, and it subsided after a single injection of 20 c. c. of serum from a pregnant woman. The authors believe that this method of serotherapy can be successfully applied to most of the toxemias of pregnancy, eclampsia, pernicious vomiting, albuminuria, etc.

Flexner reported from the laboratories of the Rockefeller Institute the development of a specific serum against meningitis due to the *Bacillus influenza* (Pfeiffer's bacillus). Experimentally, the serum was proved to possess the power of curing monkeys infected with the disease. Influenzal meningitis is a very fatal malady, all but six of the fifty-eight cases thus far collated in which the *Bacillus influenza* has been detected in the cerebrospinal fluid having terminated with death. Flexner's success with his serum for epidemic cerebrospinal meningitis seems likely to be duplicated.

SERVIA. One of the Balkan states; a constitutional monarchy in southern Europe. Capital, Belgrade.

AREA, POPULATION, ETC. Total area, 18,649 sq. miles. The population, according to the census of December 31, 1910, was 2,922,058 (2,493,882 in 1900). The marriages in 1910 numbered 29,932; births, 112,235; deaths, 64,450. Belgrade had (1910) 90,890 inhabitants; Nish, 24,949; Kraguyevac, 18,453; Leskovac, 14,236.

Only a small proportion of the inhabitants were able in 1900 to read and write. While primary education is free, state-aided, and nominally compulsory, attendance is poor. There were 1292 primary schools in 1907, with 2373 teachers and 132,051 pupils. There were secondary, special, and normal schools, and a university at Belgrade. The state religion is the Greek Orthodox, but religious liberty prevails.

PRODUCTION. In 1905 the total productive

area was 2,055,000 hectares, of which 1,027,816 were under crops and 25,815 under gardens. Vines covered 33,101 hectares, and orchards 136,940; 322,683 were under meadows, 59,855 under common and 95,709 under other pastures; while 136,399 were under worked and 166,612 under unworked forests, and 50,246 were under miscellaneous crops. The principal crops are shown for two years in the ensuing table:

	Hectares		Quintals	
	1906	1908	1906	1908

* Meadow. † Clover.

Returns for 1910 show the yield of wheat to have been 3,480,059 quintals; rye, 346,058; barley, 877,735; oats, 629,408; corn, 7,394,870. Area under sugar-beets 1910, 3011 hectares, yielding 636,545 quintals; 1911, 5028 hectares, 1,257,000 quintals.

There were in the country in 1905 989,953 cattle, 3,160,166 sheep, 174,363 horses, 908,108 swine, and 510,063 goats. Sericulture employed (1907) 9850 persons; export of cocoons, £30,538. Coal and lignite output (1907), 269,316 metric tons, valued at 3,045,621 dinars. Milling, brewing, distilling, sugar refining, and iron working are carried on; and quantities of plum preserves are put up for export.

COMMERCE, ETC. The trade for four years is given below in thousands of dinars:

	1907	1908	1909	1910
Imports	70,583	75,635	73,535	84,696
Exports	81,491	92,982	92,982	98,388

Details for two years are found below in thousands of dinars (a=textiles and raw materials; b=agricultural, animal, and forest products, foodstuffs and beverages; c=metals; d=machinery and implements; e=drugs, chemical products, and dye-stuffs; f=minerals and petroleum; g=hides and leather; h=paper; i=articles of luxury; j=stone, pottery, etc.; k=glass and glassware; l=other mdse.):

	Imports		Exports	
	1909	1910	1909	1910
a	21,930	27,128	1,571	1,863
b	15,557	18,637	83,068	86,662
c	13,662	13,550	5,237	8,023
d	6,163	6,394	8	16
e	3,647	5,004	246	361
f	3,441	3,839	2,699	1,308
g	2,996	2,674	21	30
h	1,979	2,892	28	25
i	1,731	796	9
j	989	861	89	75
k	874	793	1
l	56	2,122	5	25
Total	73,535	84,696	92,982	98,388

Germany (1910) furnished imports and received exports valued at 34,976,000 and 21,915,-

000 dinars respectively: Austria-Hungary, 16,148,000 and 17,822,000; Great Britain, 11,425,000 and 1,672,000; Turkey, 5,935,000 and 23,471,000; France, 3,604,000 and 1,191,000; Italy, 3,645,000 and 1,070,000; Russia, 1,823,000 and 14,000; Rumania, 1,180,000 and 6,570,000; Switzerland, 1,968,000 and 58,000.

Railways in operation at end of 1910, 892 kilometers; telegraph lines, 3540 kilometers; wires, 10,357; number of offices, 217; telephone lines, 2260 kilometers; wires, 12,228; number of post offices, 1500.

FINANCE. The dinar, worth 19.3 cents, is the monetary unit. Revenue and expenditure for three years have been as follows (1910 and 1911 estimates) in dinars:

	1907	1910	1911
Revenue	96,977,513	115,277,745	120,136,459
Expenditure	87,602,641	115,072,843	120,081,803

The main sources of revenue are direct taxes, 33,070,550 dinars in estimate for 1911; monopolies, 30,428,703; state railways, 14,000,000; customs, 12,930,127; domains, 7,995,804; excise, 7,765,000; etc. Principal items of expenditure were for the service of the public debt, 33,613,500 dinars; for war, 27,008,992; public works, 16,895,934; finance, 12,130,219; worship and instruction, 8,352,066; pensions and subventions, 4,759,595; interior, 4,196,482; etc. The total debt stood January 1, 1911, at 679,431,500 dinars.

ARMY. The Servian army is maintained on a skeleton basis with an average strength of about 24,000 officers and men, but during the summer recruits are added for training and the force is increased by some 10,000. Service with the colors varies in amount and often less than the stated two years for the cavalry and artillery, and eighteen months for the infantry, is passed in the ranks. The theoretical organization provides that in a war footing five divisions of the line aggregating some 125,000 men could be put under arms, later to be raised to 200,000 men. This, however, presupposes enough and better trained officers than are to be found in the army, while many of the soldiers are raw, untrained, and undisciplined. The military budget for 1911 showed a small increase on 1910, but there were no indications that the much-discussed army reorganization was being carried out. During the year, 160 quick-firing guns and 160 rounds of ammunition were ordered from Schneiders, while 100 of the old Servian 80-millimeter guns were to be converted. To test the adequacy of the military organization the Drina division on the Bosnian frontier was mobilized for manœuvres on October 16. This was stated to be a trial mobilization which would apply to all the other divisions in turn. It was considered most important and reserve officers, even those living abroad, were recalled to serve with the colors.

GOVERNMENT. The king (Peter I. in 1911) is the executive, acting through a responsible council. The legislative body is the Narodna-Skupshtina, with 160 deputies.

The ministry as constituted June 25, 1911, was composed as follows: Premier and minister for foreign affairs, Dr. M. G. Milovanovitch; finance, S. M. Protitch; interior, M. Trifkovitch; war, General St. Stepanovitch; worship and instruction, Ljubomir Jovanovitch; justice, Dr. D. Arandjelovitch; commerce, agriculture, and

industry, Milan Kapetanovitch; public works, Mihail Ilitch.

SEWAGE PURIFICATION. Most plants for the treatment of sewage have for their object the removal or reduction of a sufficient percentage of the organic matters in the sewage to permit the sewage to be turned into a stream, a lake, or the ocean without causing a nuisance. Local conditions may be such that no treatment is required, unless it be a rough screening. Sometimes sedimentation alone or aided by a chemical precipitant is needed, and again this may have to be supplemented by filtration and final sedimentation. The object in any case is the removal of a portion of the solid matters in the sewage and the conversion or reduction to a non-putrescible state of the remaining organic matters in suspension or in solution. If public water supplies or oyster beds are liable to be polluted by sewage, extreme measures will be necessary. The safest plan will be to divert the sewage to some point where it cannot infect water or oysters used for human consumption or else to arrange for a new water or oyster supply. To purify sewage so as to render it non-infectious is as yet both an expensive and, as a rule, a very uncertain plan. It may be done or approximated by thorough tank and filtre-bed treatment or by one or the other, or both, followed by disinfection with hypochlorite of calcium (chloride of lime or bleaching powder). During the last ten to fifteen years chemical precipitation as a preliminary process has been giving way to plain sedimentation, while broad irrigation or sewage farming in England and elsewhere in Europe, and intermittent sand filtration in America, have been giving way to either contact beds or percolating filters, the latter having been in the lead for some years past.

SEPTIC, TRAVIS HYDROLYTIC, AND IMHOFF TANKS. Sedimentation, either alone or assisted by chemicals, gives rise to a large volume of sludge, which consists of a few parts of solid matter in a hundred parts total, the balance being water. In the middle or late nineties Donald Cameron, of Exeter, England, put into practical operation on a large scale a modification of plain sedimentation tanks which reduced the volume of sludge. These tanks subsequently came into extensive use the world over. Briefly stated, their principle was the slow passage of the sewage through the tank and the retention of the solid matters at the bottom, while the liquid passed on and out. The exclusion of air from the tank by trapped inlets and outlets, and either by a roof or by a natural scum or mat on the surface of the tanked sewage, led to the production of immense numbers of anaërobic bacteria in the tank, and by these and perhaps other agencies a considerable but varying percentage of solids in the sludge is converted into gases and water. Some years later, Travis, of Hampton, England, modified the septic tank, in accordance with ideas suggested by the reports of the Massachusetts State Board of Health, so as to separate the tank into upper and lower compartments. The sewage flow was so divided that the major part went through the upper compartment and the sludge there deposited slipped down the inclined floor into the lower

"APPEAL TO THE GREAT SPIRIT"

Cyrus E. Dallin, Sculptor

"THAMARA"

R. Hinton Perry, Sculptor

SCULPTURE

compartment, to be subjected at length to septic action. By this means the average detention period, and thus the size of the tank, was decreased and it was claimed that a better tank effluent was secured. Still later, Imhoff, a German engineer in charge of sewage disposal for the Emscher sewerage district of Germany (Essen and vicinity), deepened the lower compartment of the Travis tank and changed the details of the upper part. He confined the lateral flow of sewage to the upper compartment, thus using the lower for sludge reduction only, and he provided for emptying the sludge at any time without stopping the use of the tank, doing this by means of the pressure of the tank liquid acting on an outlet controlled by a gate. Many of the cities and towns of the Emscher district now have Imhoff or Emscher tanks. A number of American engineers who have visited these tanks report that they are giving satisfaction, and that the sludge from them is much less objectionable than that from the original or the Travis modification of the septic tank. It should be understood that neither the septic tank nor the Travis or Imhoff modification of it afford more than a partial purification of sewage, although under certain conditions they may give all the treatment that is needed. At some of the Emscher district plants the effluent from the Imhoff tanks is filtered before it is passed into the stream.

American experiments with the Imhoff tank at Chicago and at Philadelphia have given promise of its success for the treatment of American sewage. In 1911 Imhoff tanks were completed at Batavia, N. Y., and Chatham, N. J., and were under construction for Chambersburg, Pa., the Holmesburg section of Philadelphia, and for Atlanta, Ga. There will be three of these plants at Atlanta, of 3,000,000, 5,000,000, and 8,000,000 gallons daily capacity, respectively. The contract for the smaller Atlantic plant was let late in 1910 and for the others early in 1911. It was expected that the smaller plant would be in use by March, 1912, and the others some time in 1913. All the Atlanta plants are substantially alike except in size. Before reaching the tanks the sewage will pass through a grit chamber, and on leaving the tanks it will go through five screens (36 meshes to the inch) at the smaller plants, and roughing filters at the larger plants; and thence to percolating filters composed of 6 ft. in depth of $1\frac{1}{2}$ to $2\frac{1}{2}$ -inch stone, resting on underdrains. The sewage will be sprayed on these beds through nozzles. The sludge from the Imhoff tanks will be discharged upon drying beds consisting of broken stone, with sand above and underdrains below.

The first instalment of the sewage purification works of Baltimore, Md., was completed late in 1911, but so few houses were then connected to the new sewerage system that the purification plant can scarcely be said to have been in use. The works, thus far, really consist of three settling tanks, 120 by 450 feet long, 12 acres of percolating filters, provided with spray nozzles, and two final sedimentation tanks. The sewage will be screened twice, once through coarse grating, before it goes to the settling tanks, and again through fine revolving screens between these tanks and the percolating filters. At full capacity the sewage will be retained eight hours in the settling tanks and will be filtered at the rate of 2,500,000 gallons an

acre a day. After falling eighteen feet from the final sedimentation tanks, and generating power for the use of the plant, the final effluent will flow through 2500 feet of metal-banded wood stave pipe and be discharged into Bock River, a broad arm of Chesapeake bay. Should it prove necessary to do so for the protection of oyster beds fifteen miles below the outlet, which seems unlikely, the final effluent will be disinfected, probably with hypochlorite of calcium.

SEWAGE DISINFECTION with hypochlorite has been used at Providence, R. I., since January 1, 1911, in conjunction with clarification by plain sedimentation instead of the chemical precipitation previously employed. The disinfectant reduces the bacterial content of the sewage. The sewage of Red Bank, and of one or two other small places in New Jersey is also disinfected.

THE PASSAIC VALLEY SEWAGE WORKS, described in the YEAR BOOK for 1910 as projected, had not been put under construction up to the close of 1911, although it was reported that plans had been made. Towards the end of the year, testimony was taken on the suit brought by the State and city of New York to prevent the building of these works, as designed. SHACKLETON, Sir ERNEST H. See POLAR RESEARCH.

SHALER, ALEXANDER. An American soldier, died December 28, 1911. He was born at Haddam, Conn., in 1827, and was educated at the Brainerd Academy. He entered business with his father at the age of 17 and three years later became proprietor of a stone business which he continued until 1861. In 1845 he joined the Washington Grays, which later became the Eighth Regiment of the New York State Militia. He was transferred to the Seventh Regiment in 1848 and was promoted to be sergeant and first lieutenant. He took part in suppressing the Astor Place riots in 1849. In 1860 he became major of the Seventh Regiment. When the Civil War broke out he was transferred from this regiment to the Sixty-fifth New York Volunteers, receiving the commission of lieutenant-colonel. He fought in the battles of Fair Oaks, Yorktown, Malvern Hill, and Antietam. In 1863 he was promoted to be brigadier-general of volunteers for gallantry. In the battle of the Wilderness he was captured and imprisoned, but was released in time to continue in active service. In 1865 he was brevetted major-general for meritorious services. After the war he served as major-general of the first division of the New York National Guard. He was appointed in 1867 by the governor of New York to reorganize the city fire department of New York City. He brought the department to a high state of efficiency and in 1870 was appointed commissioner. After the great Chicago

fire he was called to that city to reorganize the fire department. He was the founder of the National Rifle Association, commander of the Military Order of the Loyal Legion, and a member of many other learned and patriotic societies.

SHELDON, JOSEPH. An American lawyer, died October 25, 1911. He was born in Watertown, N. Y., in 1828, and graduated from Yale College in 1851. He studied law and after his admission to the bar began to practice in New Haven in 1853. He was an ardent Abolitionist and instituted and managed the earliest Connecticut lecture courses on anti-slavery lines. He made many speeches advocating the election of Abraham Lincoln and organized and drilled several companies of colored militia during the war. From 1868 to 1874 he was in England engaged in the manufacture of brushes. He resumed his law practice in 1874 and was elected an alderman of New Haven in 1879, serving until 1882. From 1881 to 1883 he was judge of the city court of New Haven. He was one of the speakers at the Red Cross conference at Geneva, Switzerland, in 1884. In 1904 he was candidate of the People's party for governor of Connecticut. He was the author of many public speeches, pamphlets, and magazine articles in aid of reforms and various philanthropies.

SHENG HSUAN-HUAL. See CHINA.

SHEPARD, EDWARD MORSE. An American lawyer and publicist, died July 28, 1911. He was born in New York City in 1850. His father died when the boy was six years of age, and the latter became the ward of Abram S. Hewitt. He attended the schools of New York City and then entered Oberlin College. Here he remained but one year. Returning to New York he entered the College of the City of New York, graduating in 1869. After graduation he studied law in the office of John E. Parsons and was admitted to the bar in 1875. In the year following he formed a partnership with Albert Stickney, which continued until the formation of the law firm of Parsons, Shepard & Ogden in 1890. For several years he remained a member of this firm and then withdrew, thenceforward conducting his legal business alone. From his early youth he took an active interest in politics. Before he was admitted to the bar he was one of the organizers of the Brooklyn Young Men's Democratic Club and he served as its president for three years. Out of this organization grew the Brooklyn Democratic Club. From 1883 to 1885 Mr. Shepard was chairman of the Brooklyn Civil Service Board and he was active in preventing the legal granting of franchises to corporations. He became in 1884 a member of the State Forestry Commission and assisted in the investigation of Adirondack and Catskill forest conservation and recommended remedial legislation. In the national campaign of 1892 he strongly advocated the election of Grover Cleveland. A few years later he organized the Independent Democracy and opposed the nomination of David B. Hill for governor. Following the defeat of Hill, Mr. Shepard was practically the dictator of the Democratic organization of Brooklyn. Soon

after, however, he became the candidate for mayor of Brooklyn against Frederick W. Wurstler, Republican, and Edward M. Grout, regular Democrat. He was decisively defeated. Following the nomination of William J. Bryan in 1896 Mr. Shepard voted the Democratic ticket, and became the gold Democrat delegate to the convention that nominated Palmer and Buckner. In the following year he supported Seth Low, the Republican candidate, as mayor of New York. In this campaign he bitterly assailed Tammany Hall, calling it "the most burning, disgraceful blot upon the municipal history of this country." In spite of this, however, he accepted the nomination for mayor at the hands of Tammany against Mr. Low in 1901. In this campaign he was beaten. Mr. Shepard supported Bryan in his second nomination for the presidency in 1900 and was a delegate to the national convention in which the nomination was made. In 1904 he came out strongly for the candidacy of anyone but Bryan. He worked hard for the election of Alton B. Parker. In 1908 he again supported Mr. Bryan on the ground of the necessity for revising the tariff. When the Democratic legislature was elected in the fall of 1910, Mr. Shepard at once became the most prominent candidate for United States Senator to succeed Senator Depew. He failed to receive the support of Tammany Hall and the State Democratic organization and was opposed by William F. Sheehan. After a long deadlock, Mr. Shepard withdrew his name. See NEW YORK, *Politics and Government*.

Mr. Shepard was one of the most eminent lawyers in the United States. His legal work was largely done as counsel for large corporations, and as special attorney-general he directed the prosecution of John Y. McKane, and appeared in other well-known cases. For several years previous to his death he was counsel for the Pennsylvania Railroad in New York City. He wrote a biography of Martin Van Buren in the American Statesmen series and *Memoirs of Dungdale*. He also contributed articles on political, industrial, and educational topics to reviews and magazines.

SHERWOOD, WILLIAM HALL. An American pianist and composer, died January 7, 1911. He was born at Lyons, N. Y., in 1854, and graduated at the Lyons Musical Academy, of which his father was founder and principal. He studied in the United States under several well-known musicians, and with Kullak in Europe, with Deppe at Berlin, and with Liszt at Weimar. He also studied the organ and was for some time organist of the English church at Stuttgart and of the English chapel at Berlin. He played in the principal cities of Europe and Canada and in all parts of the United States. He was director of the Sherwood Musical School and was composer of many pieces of music for the piano. He was the author of *University Extension Course of Music Study and Piano Playing*, and *Music Study and the Mutual Relations of Interpretation and Technic*.

SHIPBUILDING. The annual report of shipbuilding in various countries, compiled by Lloyd's Register, shows that in 1911 the total merchant tonnage built in all countries was 2,650,140—the measurement of 1599 ships—as compared with 1,957,853 tons in the previous year. For a correspondingly high total it is necessary to go back to 1907, when the total tonnage was 2,778,088, and to 1906, when it was

2,919,763, as these were the record years. In 1911 Great Britain contributed 68 per cent. of the total gross addition to the world's merchant fleet, which was a better record relatively than in the two years of abnormal activity already referred to, the proportion for 1907 having been 58 per cent. and for 1906 63 per cent. Taking the average of these annual statistics it is safe to consider 60 per cent. of the tonnage for the world's merchant marine built in Great Britain, leaving only 40 per cent. to be contributed by other nationalities.

The output of warship tonnage throughout the world in 1911 was greater than in any previous year for which figures had been collected by Lloyd's. In fact, the tonnage launched in 1911 exceeded that of any previous two consecutive years combined, being 768,869 tons, as compared with 310,854 tons in 1910 and 404,475 tons in 1909. The highest total previously recorded was in 1901, and consisted of 467,547 tons. In numbers also records were broken, as there were 169 vessels in 1911, as compared with 123 in 1901.

In considering the distribution of this warship tonnage it was pointed out that the British fleet was being increased *pro rata* with that of the other powers combined, although not with some individual powers. During the year 1911 there were launched for the British fleet 41

	1909	1910	1911
Austria-Hungary	47,223	29,297	58,105

Total	2,006,532	2,268,707	3,419,009

SHIPBUILDING IN COAST YARDS. The activity of the year 1911 in the coast shipbuilding yards of the United States was comparatively limited. The battleship *Moreno* for the Argentine Republic, a 27,600 ton vessel, 595 feet in length, was under construction at the Camden yards of the New York Shipbuilding Company, as was also a cruiser for the Chinese government, 2600 tons displacement, and 300 feet over all. Both of these vessels were equipped with turbines, and 3 screws; the *Moreno* with a Curtiss turbine, and the Chinese vessel with Parsons turbines.

The following table shows the tonnage of vessels of 100 tons gross and upwards (excluding warships) launched in the United Kingdom and abroad during the years 1907-1911:

	U. K.	Aus.- Hun.	Br. Col.	Den.	Fr.	Ger.	Italy	Jap.	Neth.	Nor.	U. S.	Other	Total
	tons	tons	tons	tons	tons	tons	tons	tons	tons	tons	tons	tons	tons

vessels, of 221,430 tons, equal to about 29 per cent. of the total tonnage of all powers, or about the average ratio. Between 1896 and 1900 the proportion was 31¼ per cent., between 1901 and 1905 it was nearly 35 per cent., and between 1906 and 1910 it was 29½ per cent. In 1911 Germany had completed 28 vessels, of 128,340 tons, which was more than 30 per cent. greater than in any previous year. Russia launched five vessels, of 93,260 tons, but in 1910 she had launched no warship. Italy made the large addition of 15 vessels, of 75,018 tons, which was equal to the total of the preceding four year combined. The United States added 13 vessels, of 57,526 tons; France 15 vessels, of 53,995 tons; and Austria-Hungary, two vessels, of 20,269 tons. See BATTLESHIPS and NAVAL PROGRESS.

The table at top of next column shows the tonnage of merchant vessels and warships (over 100 tons), launched in each maritime country:

This yard had under way a large side-wheel passenger steamer, the *Washington Irving*, for the Hudson River Day Line, 414 feet long, 86 feet beam; 2 oil steamers for the Standard Oil Company, 342 feet in length, 3500 gross tonnage; and an oil steamer for the Gulf Refining Company 406 feet over all, and an estimated gross tonnage of 5200.

At Seattle, Wash., the Moran Company was building 5 steel steam whalers and a small passenger vessel. The Cramp yards at Philadelphia were building 2 small steel cruisers for the Cuban government, and 6 steel coal barges. At Quincy, Mass., the Fore River Shipbuilding Company had under construction the battleship *Rivadavia* for Argentina, 585 feet over all, and 30,200 tons full load displacement, at an approximate cost of \$11,000,000. This ship, like the *Moreno*, will have 3 Curtiss marine turbines. This company also had under construction the suction dredge *New Orleans* for the United States War

Department, a vessel 315 feet in length, with 4 triple-expansion engines, at an approximate cost of \$400,000. See DREDGING.

At Newport News, the Newport News Ship and Dry Dock Co. was building 2 freight steamers, while at Sparrows Point, Md., the Maryland Steel Company had under construction 5 steel steam freight ships for the American-Hawaiian Steamship Company of New York, each 429 feet 2 inches in length with an estimated gross tonnage of 8600. The foregoing represents the more important work in the coast shipyards of the United States.

The table below shows the ships built and documented in the United States (fiscal years ended June 30), from the report of the commissioner of navigation:

	1910		1911	
	No.	Gross tons	No.	Gross tons
Atlantic & G'l Coasts	601	150,828	588	163,178

GREAT LAKES. During 1911 the ship concerns in the United States on the Great Lakes launched 42 vessels, as compared with 51 in 1910. Of these 9 were bulk freighters, 4 for coast service, as compared with 20 bulk freighters in 1910; 2 baggage freighters for coast service, as compared with 3 in 1910; 2 were passenger steamers, the same number as in the previous year; 2 were oil steamers, 5 oil barges, 8 tugs, as compared with 12 tugs in 1910; 1 fuel lighter, 1 sand steamer, 1 car ferry, as compared with 3 car ferries in 1910; 3 tow boats, 4 scows, 2 light vessels, 1 river lighter, and 1 car float. The American Shipbuilding Company launched 19 of the vessels in 1910, including 4 bulk freighters for the lakes. The 5 lake bulk freighters launched have a carrying capacity of 55,000 gross tons in a single trip, or 1,100,000 tons in an average season of 120 trips. One of the vessels, the *Schoonmaker*, the largest vessel on the lakes, is 617 feet in length and at full draught has a gross carrying capacity of 14,000 tons. It was built at the Ecorse yards of the American Shipbuilding Company.

GREAT BRITAIN. Increased activity in the maritime interests, satisfactory freight rates, and growth of foreign commerce led to a marked gain in the new tonnage launched from British yards in 1911. This was stated at 747,216 tons, or 55½ per cent. greater than in 1910, and 58,000 tons, or 2.8 per cent. greater than in 1906, the previous year of highest totals. The

particulars of the distribution are shown in the accompanying tables. There were no serious labor disputes during the year, which, however, was not one of great profit for the shipbuilders.

No notable fast ocean steamships were built, though a number of large size, the more important of which are summarized in the table. The *Olympic*, launched in 1910, was put into service and made several successful trips until injured in a collision with H. M. Cruiser *Hawke* on September 19 in the Solent.

Aggregates of production in the United Kingdom, 1910 and 1911 (from *Engineering*, London), are given as follows:

	1910 tons	1911 tons
Steam tonnage*	1,985,184	1,244,930
Sailing tonnage	47,874	43,660
Totals	2,033,058	1,288,590
His Majesty's Dockyards.....	55,600	52,852
Grand totals	2,088,658	1,341,442
Colonial and for.-owned tonnage	400,000	245,636
Per cent. of total.....	20.0	18.3
Total merchant tonnage†.....	1,858,624	1,209,255
Per cent. of steam merchant tonnage to total merchant tonnage	97.5	96.5
Horsepower of engines.....	2,241,500	1,671,600
Per cent. of all naval tonnage to merchant tonnage.....	13.6	10.9

* Includes warships built in private yards.
† Excludes British and foreign warships.

The above table includes vessels smaller than the 100-ton limit observed by Lloyd's Register.

Notably large merchandise steamers built in British yards in 1911 (from *Engineering*, London) are seen below:

Name	Tons	I.H.P.	Builders

* Engines by the Wallsend Shipway and Engineering Company Limited.

GERMANY. After Great Britain Germany ranked next in respect of output of merchant ships, supplying 9.7 per cent. of the year's total, or about its average amount. There were launched 154 vessels, of a total of 255,532 tons, or 96,000 tons more than the output of the previous year, and about 63,000 tons less than the total built in 1906, the record year. Lloyd's figures, however, did not take into account vessels built on the upper rivers, the total of which was about 17,000 tons. The largest vessel was the *Cap Finisterre*, of 14,503 tons, and there were 16 others over 5000 tons. Germany was taking a prominent part in the fitting of oil-engines, and one vessel, of 4500 tons, was launched at Kiel, and 13 other vessels, of an aggregate of 2000 tons, were launched, and were being fitted with internal-combustion engines. (See INTERNAL-COMBUSTION MOTORS.) Germany again had the credit of building the largest steel sailing vessels of the year; there were two of them, the *Peking* and the *Passet*, each of 3100 tons, and both launched at Hamburg. As regards the warship work, there were launched in Germany 28 vessels, of 128,340 tons, which was considerably more than half the output of Great Britain; moreover, the total output was about 30 per cent. higher than in any preceding year.

FRANCE. France in 1911 ranked third, with a total output of merchant shipping of 79 vessels, of 125,472 tons, which was very much higher than in any previous year since 1902, the output having dropped to 35,000 tons in 1906 and to 42,000 tons in 1909. The most notable ship launched was the *Rochambeau*, of 12,678 tons; the only merchant ship hitherto fitted with combination machinery on four shafts, there being two reciprocating and two low-pressure turbine-engines. Another large ship was the *Paul Lecat*, of 12,550 tons, while in addition there were five others over 5000 tons. A notable full-rigged ship was the *France*, of 4920 tons, launched at Bordeaux, and fitted with twin-screw Diesel engines, to be used as auxiliaries in calms or against head winds. The naval work in France included 15 vessels, of 53,995 tons, which, with the exception of 1909, is the highest since 1896, and was indicative of a more earnest desire to bring the French navy to the high position among modern fleets which the history of France so thoroughly justifies.

NETHERLANDS. The Dutch launched for the merchant marine 113 vessels, of 93,060 tons, which exceeded by 22,000 tons the output for 1910, and is the highest recorded by Lloyd's Register. The totals, however, did not include the craft exclusively intended for river navigation, of which over 20,000 tons were launched during 1911. The largest of the Dutch steamers was the *Koningin des Nederlanden*, of 8176 tons, built at Amsterdam. Five other steamers were over 500 tons. Nine of the vessels launched are to be fitted with oil-engines, but the total tonnage of these is only 3100 tons.

JAPAN. Japan launched 109 merchant vessels, of 44,359 tons, a fairly large increase of output over 1910. In this total, however, was included the *Shinyo Maru*, of 13,377 tons, and one other steamer of about 6000 tons. There were also launched six warships, of 37,071 tons, scarcely equaling the amount of some previous years.

AUSTRIA-HUNGARY. Austria-Hungary exhibited a decided increase in the output. In 1910 the total was only eight merchant vessels, of

14,304 tons, whereas in 1911 it was 16 vessels, of 37,836 tons.

NORWAY. The Norwegian output was below the average, being 71 merchant vessels, of 35,435 tons, which, although slightly above the 36,931 tons of 1910, was less than some of the preceding years, when the average was nearer 60,000 tons.

The output of the **BRITISH COLONIES** was 7000 tons less than in 1910. In **DENMARK** the increase was 50 per cent., and included the vessel *Selandia*, of 4900 tons, built by Burmeister & Wain of Copenhagen, and being fitted with Diesel engines. This is the sister ship of the *Jutland*, launched by Messrs. Barclay, Curle & Co., on the Clyde, to be fitted with the same design of engine. The output for **ITALY**, which was 17,401 tons, was the lowest recorded since 1897.

NOTABLE INTERNAL-COMBUSTION SHIPS OF 1911. The tank ship *Vulcanus*, built by the Nederlandsche Fabriek of Amsterdam for the Nederlandsche Indische Tankstoomboot Maatschappij, is a vessel of 1900 tons displacement, with a carrying capacity of 1000 tons. It is fitted with a 500-horsepower six-cylinder 4-cycle Diesel engine, and, after six months' trial, in coast water trips, made a 19-days' run of 3300 miles to Constanta, maintaining a speed of about 7¼ knots, with a consumption of 2.15 tons of coal per 24 hours. The success of this vessel led to the construction of two other vessels, for the same company by the same builders, which were to have double the horsepower. The first internal-combustion ship to cross the Atlantic was the *Toiler*, built by Swan, Hunter & Wigham Richardson, Ltd., in England, having a carrying capacity of 2500 tons and fitted with twin-screw engines of 350 combined horsepower. These engines were built by the Swedish Diesel Motor Company, of Stockholm, and were of the two-cycle type. The third Diesel engine ship of interest during the year was the Italian vessel *Romagna*, constructed for the Trieste, Ravenna, and Fiume service, in which it was operated but a few months, being lost in a November gale. This was a combined passenger and cargo ship, with a speed of 12¼ knots and propelled by two sets of 400-horsepower Sulzer-Diesel engines. An important application of the Diesel engine which promises to have considerable interest in maritime circles was as auxiliary to large sailing ships. The French four-masted ship *Quevilly* during the year was fitted with two sets of 300-horsepower Maschinen-Fabrik Augsburg-Nürnberg A. G. engines. This ship has about 6000 tons displacement, and it was believed that the use of the Diesel engine on such a vessel would prove most economical and advantageous, as it would save towage charges and be available in case of calms, and at the same time there would be no stand-by losses or embarrassment due to any disarrangement or failure, since its function would be merely auxiliary, and the safety of the ship would not be imperiled.

Another type of engine making its appearance during the year on a ship of larger size than any yet constructed for this equipment was the suction gas engine installed on the *Holzappel I.*, a ship of 290 tons gross register, built in England by Eltringham of South Shields, for the Holzappel Syndicate. This vessel had a set of six-cylinder 180-horsepower gas engines built by E. S. Hindley & Company of Bourton, which

transmit their power at 450 revolutions per minute through a Föttinger hydraulic power transformer, by which the speed is reduced so that the propeller revolves much more slowly and efficiently. This vessel made a number of coast voyages about England during the year, at a consumption varying from $1\frac{1}{4}$ tons to 1.6 tons of coal per 24 hours. An older vessel fitted with gas engines was the *Progress*, which had a three-cylinder double-acting two-cycle gas engine installed on an experimental basis, in order to ascertain the conditions under which a new engine best could be designed under conditions approximating those of the steam.

Aside from the foregoing vessels and a large number of submarines there was considerable construction of marine gas engines in progress during the year in Europe. The Woermann liner, a twin-screw ship with double-acting engines of 2400 combined horsepower, which were being built by the Maschinen-Fabrik Augsburg-Nürnberg A. G. and by Messrs. Blohm & Voss, was under construction. The Hamburg American line was constructing a new ship of 9000 tons for its South American service which

Burmeister and Wain engines of 1250 horsepower each; and twin-screw 4000-ton oil tankers for the German Petroleum Company, which were being supplied with engines of 750 horsepower each by Frerichs & Company under license from Professor Junkers. The same builders were also constructing two 9400-ton vessels with 3300 combined horsepower and Junker engines. In addition to this continental work, engines for a 3000-ton capacity ship were put under construction in England by Richardsons, Westgarth & Company. They were of the four-cylinder two-cycle Carls-Westgarth type, and were of 800-horsepower capacity. Barclay, Curle & Company were building eight-cylinder sets of four-cycle 2500 combined horsepower engines, and the Thornycroft Company and the Vickers Company were reported to be working on internal-combustion motors for naval purposes, especially for cruisers.

In the table below are given the steam and sailing vessels of over 100 tons, number and net and gross tonnage of the several countries of the world as recorded in Lloyd's Register for 1911-12.

THE WORLD'S LARGEST STEAMSHIP, 1911

WHITE STAR TRIPLE-SCREW STEAMSHIP "OLYMPIC" 45,000 TONS REGISTER, 66,000 TONS DISPLACEMENT, 883½ FEET LONG, 94 FEET BEAM

strong of Seattle won the revolver contest with a score of 467. The pistol championship was awarded to Parmly Hanford of New York City, who scored 466 points. A. P. Lane, also of New York, captured the military championship with 605 points. The military revolver team match was won by the team representing the First Cavalry of the Illinois National Guard, which was made up of Lieut. S. Peterson, J. L. Byrne, Col. W. H. Whigam, and John Turner.

In trap-shooting C. C. Collins of Alldine, Ind., won the national amateur championship, scoring 196 targets out of 200. The professional championship was captured by Lester S. German of Aberdeen, Md., who made 198 targets out of 200. German also won the double target championship with 89 out of 100 targets. H. Dixon of Oronogo, Miss., was the winner of the Grand American Handicap Tournament conducted by the Interstate Association. W. R. Davies won the Canadian individual championship.

SHORT BALLOT. See **ELECTORAL REFORM** and **MUNICIPAL GOVERNMENT**.

SHUSTER, W. MORGAN. See **PERSIA, Finance and History**.

SIAM. An independent kingdom in south-eastern Asia; a buffer state between British Burma and French Indo-China. Capital, Bangkok.

AREA, POPULATION, ETC. Estimated area, 200,000 sq. miles; population, according to figures published in November, 1910, 7,561,977 (Siamese, Chinese, Shans, Laos, Malays, Burmese, Cambodians, etc.). France and Great Britain have made great inroads upon Siamese territory. Bangkok had, in 1909, 628,675 inhabitants (379,118 males and 249,557 females). Buddhism is the state religion, and the priests are in large measure in charge of educational matters.

PRODUCTION. Rice and teak are the chief products for export. By irrigation the area under rice has been greatly increased. The amount exported in 1908-9 was 518,367 tons; in 1909-10, 952,889. There are 26 rice mills (2 British, 2 German, 22 Chinese) in Bangkok. In the great forests of the north the teak industry is carried on, mainly by British enterprise. Quantity exported 1908-9, 76,930 tons; 1909-10, 76,090. Other products are fruits, pepper, hemp, sesame, and tobacco. Cattle and hides are exported. Rubies, sapphires, and tin are the most important minerals. Rubies exported 1908-9, £4237; 1909-10, £1260; sapphires 1906, £75; tin 1908, 2392 tons and 3713 tons of ore.

COMMERCE AND COMMUNICATIONS. More than 75 per cent. of the oversea trade is with Great Britain, much of it passing through Singapore and Hongkong; though German and Norwegian shipping exceed British.

The trade by countries in the year 1910-11 is shown below in thousands of ticals (one tical = about 36.5 cents); a large part of the Singapore and Hongkong trade is transit en route for Great Britain.

The export of rice was valued at 91,061,000 ticals; teak, 7,625,000. The chief imports are cotton goods and yarn, treasure, silks, provisions, gunny sacks, kerosene, sugar, opium, metal and metal wares, and machinery. Vessels entered (1910-11), 927, of 865,607 tons; cleared, 928, of 867,005. The merchant marine (1911) was composed of 22 steamers, of 8924 tons, and 43 junks, of 4794.

Railways (1911), 1090 kilometers, of which 984 kilometers are state-owned. A line runs from Bangkok to Korat, with a northward branch to Utaradit. Another line runs from Bangkok to Petchaburi, and is being extended down the Malay Peninsula; when completed it will connect Bangkok and Singapore. Other lines connect Bangkok with Patiew, Paknam, and Meklong via Tachin.

Telegraph lines 984 kilometers; wires, 10,628; number of offices, 131; telephone lines 73 kilometers; wires, 5113; number of post offices, 179.

NAVY. The navy includes 1 protected cruiser of 2800 tons, which serves as a royal yacht; 4 gunboats (500-700 tons each), 3 torpedo boats (90 tons each), 1 torpedo-boat destroyer (380), together with small craft, transports, dispatch boats, etc. The active personnel is made up of 5000 officers and men; the reserve, of 20,000.

FINANCE AND GOVERNMENT. The tical (worth about 36.5 cents, but fluctuating with the price of silver) is the unit of value. The revenue for 1911-12 was estimated at 62,321,000 ticals: 32,913,362 from opium, spirits, and gambling farms; 7,302,928 from capitation taxes, 6,032,900 from customs, 4,285,000 from railways; octroi, 1,785,200; forests, 1,674,600; posts and telegraphs, 1,147,895, etc. Expenditure, 73,910,608 ticals: 11,837,373 for interior, 11,365,460 for war; civil list, 10,362,167; administration, 4,482,968; public works, 4,117,449; finance, 3,151,977; justice, 3,017,284; extraordinary (for railways and irrigation), 11,675,069, etc. The debt stood in 1911 at £7,000,000; paper currency, March 31, 1911, 18,770,220 ticals.

The sovereign (1911, Mala Vajiravudh, succeeded, October 23, 1910) is absolute monarch. He is aided in his executive functions by a council of ministers, nearly all of whom are his relatives. The legislative body is composed of the ministers, other crown-appointed members, and 14 princes of the royal house. The king has absolute power of veto over all legislation. In the various state departments are employed a number of French, English, Germans, Italians, Danes, and Japanese.

SIBERIA. See **EXPLORATION** and **RUSSIA**.

SIDIS, BORIS. See **LITERATURE, ENGLISH AND AMERICAN, Essays and Literary Criticism**.

SIERRA LEONE. A peninsula on the west coast of Africa; a British colony and protectorate. The colony has an area of 4000 sq. miles (population, 1911, 75,572), and the protectorate, about 30,000 (1,300,000). Freetown, with 37,280 inhabitants, is the capital and chief port. The imports were valued in 1910 at £1,162,470 (cotton goods, apparel, coal, hardware, provisions, and tobacco); the exports at £1,249,367 (palm oil, palm kernels, kola nuts, hides, beeswax, rubber, gum-copal, benni-seed, and rice). An extension to the Freetown-Pendembu railway (227 miles) will run to the Rokelle River. The revenue and expenditure (1910) amounted to £424,215 and £361,222 respectively. The governor in 1911 was Sir E. M. Merewether.

SIEVERS, WILHELM. See EXPLORATION.

SILK. The silk industry in 1911 was marked by an increased output of raw silk over that of the previous year, and a decrease in the production of American silk looms. There was, also, a general decline in values, and the lowest raw silk prices were reached early in November. Silk, like other fabrics, felt the effects of the prevailing fashions, and while silk fabrics for dresses continued in vogue the actual yardage was decreased, and prices failed to remain at a satisfactory point. It was said that plain goods were manufactured in the majority of the mills without profit.

The silk market in Europe suffered considerably from political questions, including especially the Moroccan negotiations, the war between Italy and Turkey, and the disturbances in China. The drouth in Europe was also a factor during the year, as the cost of living was increased, and the consumption of luxuries necessarily curtailed. As a result the rate of consumption by European dealers and manufacturers showed a decrease of about 2,000,000 kilograms in the year 1911, which was in part due to the decrease in raw silk shipments from Europe to the United States, where Chinese silks were used in preference.

SILK CROP ESTIMATES. The world silk crop of 1911-1912 at the end of the year was estimated at about 23,200,000 kilograms, or from 3 to 4 per cent. in excess of the crop of 1910. The production of Italy, amounting to not over 3,500,000 kilograms, was again below the average and was less than in 1910, when the production amounted to 3,950,000 kilograms, as compared with 4,250,000 in 1909. The French crop for 1911 was about 100,000 kilograms greater than that of 1910, which was the smallest on record. On the other hand, all of Asia, with the single exception of Canton, showed an increase which more than balanced the European deficiency. The estimated increase in China and Japan was in excess of 10 per cent., though the original figures for the Japanese crop of 170,000 bales were modified later in the season to 160,000 bales, while a similar modification was necessary for the Canton production, where the original estimate of 52,000 bales was reduced to 45,000 bales, or less than the production in 1910. The accompanying table from the *American Silk Journal* gives the estimated totals of the different countries compared with the results for the past two years (in kilograms):

	1911	1910	1909
Europe	4,350,000	4,700,000	5,380,000
Levant	2,850,000	2,700,000	3,100,000
China	3,960,000	3,500,000	3,940,000
Canton	2,160,000	2,620,000	2,240,000
Japan	9,600,000	8,850,000	8,280,000
India	240,000	220,000	240,000
	23,160,000	22,590,000	23,190,000

The average silk production (of the seasons 1908-9, 1909-10, 1910-11, 1911-12) and average consumption (years 1908, 1909, 1910) of the world, computed on the basis of several years by Messrs. Chabrières, Morel & Cie., of Lyons, France, are given in the accompanying table.

While the imports into the United States of silk manufactures remain at about the same amount the increase in the value of the domestic product continues, and for 1910 it was esti-

AVERAGE SILK PRODUCTION, SEASONS 1908-1911

mated at \$196,000,000. (See UNITED STATES, Commerce.) In 30 years the position of the imports and domestic manufactures has been revised and the United States supports a flourishing industry. The number of mills manufacturing silk goods on December 31, 1911, totaled 1455 against 1399 operating December 31, 1910, according to the annual issue of *Davison's Silk Trade*. New Jersey led in the number of mills producing broad silks and ribbons, having 203 broad silk mills, against 113 for Pennsylvania, and 50 ribbon mills, against 46 for the latter State. Pennsylvania, however, greatly outnumbered New Jersey in the number of mills for throwing and spinning silk and for the manufacture of silk knit goods. The total number of broad silk mills in the country at the end of 1911 was 17 less than in the previous year, and the number of ribbon mills showed a decrease of 9. There were 3 more throwsters, but it was in the silk knit goods end of the business that the greatest gain was shown, there being 250 such concerns in the United States in 1911, against 165 in 1910, a gain of 85. Twenty-six mills were engaged in the manufacture of cotton and silk mixtures, of which mills there was no total given in the 1910 record. Warpers, winders, spoolers, quillers, etc., showed an increase of 3, and dyers and finishers, printers, etc., show 130 for 1911, against 123 for 1910.

SILVER. The total production of silver in 1911 was 57,796,117 fine ounces, which was slightly in excess of the product for 1910. The amount and value of the product in 1911 are shown in the following table, which was prepared by the Director of the Mint:

State	Fine oz.	Value
Alabama	174	\$ 96
Alaska	275,691	151,630
Arizona	1,694,428	876,935
California	2,727,336	1,500,095
Colorado	7,530,940	4,142,017
Georgia	225	124
Idaho	7,507,802	4,129,291
Illinois	4,648	2,556
Michigan	507,234	278,979
Missouri	56,228	30,925
Maryland	87	48

State (cont.)	Fine oz.	Value
Montana	11,116,778	6,114,228
Nevada	10,651,571	5,858,364
New Mexico	1,142,335	628,284
North Carolina	2,227	1,225
Oklahoma	168,245	92,535
Oregon	69,116	38,014
Pennsylvania	13,262	7,294
Philippine Islands.....	8,383	1,861
Porto Rico	51	28
South Carolina	14	8
South Dakota	206,188	113,403
Tennessee	126,683	69,676
Texas	442,486	243,367
Utah	12,679,633	6,973,798
Virginia	45	25
Washington	142,196	78,209
Wyoming	1,009	555
Miscellaneous	826,102	454,356
Total	57,796,117	\$31,787,866

The silver produced in 1910 was almost exactly the same as in 1911.

In 1911 Utah attained first rank as a producer of silver, passing Montana and Nevada, which held first and second ranks in 1910. Utah, Idaho, and California were the only States making notable gains in 1911. Colorado, Nevada, and Montana showed notable decreases. The production of silver in the world in 1911 was about 222,000,000 fine ounces, which was practically the same as the product in 1910. There was a decrease in Mexico owing to disturbed political conditions. There were, however, increases in Canada and Australia.

SILVER MARKET. The market for silver in 1911 was affected chiefly by the conditions in the East and also by speculations carried on by Indian and Chinese capitalists. This forced up the price in the latter part of the year to a point considerably above the uniform level of the earlier months. The monthly average prices of silver in New York and London during the year 1910-11 are shown in the following table, taken from the *Engineering and Mining Journal*.

Month	New York 1910	New York 1911	London 1910	London 1911
January	52.375	53.795	24.154	24.865
February	51.534	52.222	23.794	24.081
March	51.454	52.745	23.690	24.324
April	53.221	53.325	24.483	24.595
May	53.870	53.308	24.797	24.533
June	53.462	53.043	24.651	24.486
July	54.150	52.630	25.034	24.286
August	52.912	52.171	24.428	24.082
September	53.295	52.440	24.567	24.209
October	55.490	53.340	25.596	24.594
November	55.635	55.719	25.680	25.549
December	54.428	54.905	25.160	25.349
Total	53.486	53.304	24.670	24.592

For the amount of silver coined in the United States in 1911, see **UNITED STATES**, paragraph *Coinage*.

SIMPLON TUNNEL. See **SWITZERLAND**, *Railways*.

SINGAPORE. See **STRAITS SETTLEMENTS**.

SINGER, PAUL. A German politician, parliamentary leader of the German Social Democratic party, died January 31, 1911. He was born in Berlin in 1844. His education was obtained at a realschule, and at the age of twenty-five he went into partnership in a millinery manufactory in which he made a considerable fortune. In 1884 he became a member of the Berlin municipal council, and he was one of the twenty-five Socialist members who were elected to the Reichstag in that year. He became almost im-

mediately a member of the party committee and in 1886 was expelled from Berlin under the powers granted the police by the law against socialism as passed in 1878 and renewed from time to time until 1890, the year of the fall of Bismarck. As a result of this expulsion he gave up business and devoted himself entirely to politics. When the law against socialism was municipal council, and he was one of the twenty-years before his death he largely controlled the destinies of the Socialist party and was undoubtedly responsible, in a high degree, for its extraordinary expansion in Germany. He was leader of the party both in and out of Parliament and presided not only over the party meetings, but over many national and international congresses outside. As a speaker he was not brilliant, but his remarkable talent as an organizer had great influence in politics both within and outside his party.

SIPHON LOCKS. See **CANALS**.

SKATING. The international outdoor skating championships were held at Montreal in January. R. L. Wheeler of Montreal and Harry Kaad of Chicago were credited with the best performances. Wheeler won the mile and half mile races and finished second in the 3-mile race. Kaad won the 3-mile event and finished second to Wheeler in the mile. Edmund Lamy of Saranac captured the 220-yard race for the second year in succession. The 220-yard hurdles went to F. J. Robson of Toronto. In the international indoor championships, held at Chicago, Lamy made a clean sweep by capturing the 220-yard race, 440-yard race, half-mile, mile, 2-mile, and 3-mile scramble events. The national outdoor championships were held at Saranac Lake. Lamy won the quarter-mile, half-mile, mile, and 3-mile events. L. Roe of Toronto won the 220-yard race and Wheeler was victor in the 2-mile event. Robson won the hurdles. At the national indoor championships held at Cleveland, Lamy won the quarter-mile race and the 1¼-mile race, and Robert McLean of Chicago captured the half-mile and mile events.

Strunikof, the Russian skater, for the second successive year won the point trophy at the world's championships held at Trondhjem, Norway. He captured every event. The same skater also won the European championship at Hamar, Norway. The winners of the various championships in roller skating in the United States in 1911 were: One mile Eastern professional, Harry Burke of Bridgeport, Conn.; 3-mile Eastern professional, C. Lowney of Newark; 5-mile Eastern professional, Harry Burke; 1-mile Eastern amateur, Edward Burton of Brooklyn; 2-mile Eastern amateur, H. Wimmer of Newark; 3-mile Eastern amateur, J. Timmey of Newark; 5-mile Eastern amateur, H. Wimmer; 1-mile professional, Edward Schwartz of Chicago.

SLEEPING SICKNESS. The British government in 1911 sent out another commission to central Africa to investigate sleeping sickness. The expedition was in charge of Col. Sir David Bruce, assisted by Captain Hamerton and Professor Newstead of the Liverpool School of Tropical Medicine. The commission, which went out under the auspices of the Royal Society, is expected to be absent from England for three years. One of its principal objects is to ascertain whether the fly which is supposed to convey the disease depends on the presence of big game. If this is proved to be so it may involve

the wholesale destruction of wild animals. Bruce, Hamerton, and Bateman have already shown that antelopes may act as a sleeping sickness reservoir. They sought the reason why, though the population had been removed for over two years, the tsetse flies on the north shore of Victoria Nyanza continued to infect monkeys with sleeping sickness. Man in these areas had been replaced by large game and it seemed probable that these might be harboring the parasites, and especially so because the commission had already found that cattle may do so. By a very complete and convincing series of experiments, they proved that antelopes could readily be infected with the *Glossina palpalis* and that these could transmit it to other *glossinae*, who in turn could infect susceptible animals by their bite. Another interesting point is that the trypanosome of sleeping sickness is believed to be conveyed in Nyassaland by a fly other than the tsetse, the chief carrier in other parts of central Africa, for none of this species has as yet been found in this country.

SMALL ARMS. See MILITARY PROGRESS.

SMALL HOLDINGS. See AGRICULTURE.

SMALLPOX AND VACCINATION. There were 23,263 cases of smallpox in the United States during 1911, with 105 deaths, mostly in those States where vaccination is not compulsory. These figures indicate that voluntary vaccination is not an efficient safeguard. Vaccination should be enforced by law in every State. Dock pointed out the fact that of 2000 patients received in the wards of one hospital, only 60 per cent. had been vaccinated, even once. See also VITAL STATISTICS.

SMITH, ARCHIBALD CAREY. An American naval architect, died December 8, 1911. He was born in New York City in 1837 and was educated at the University Grammar School in that city. After learning the boat-building trade under Robert Fish, he built in 1860 the sloop *Comet*, which held the American championship for several years. A few years later he built the *Vindex*, the first iron vessel built in the United States. Following this was the *Mischief*, another iron vessel, which successfully defended the *America's* cup against the *Atlanta* in 1881. In 1885 he devised and superintended the construction of the *Priscilla*, which was also intended to defend the *America's* cup. She, however, was defeated by the *Puritan* and in the following year by the *Mayflower*. Other noted vessels designed by him were the *Iroquois*, the *Meteor*, for the German emperor, and the motor boats *Ailsa Craig* and *Eronel*. In 1911 he designed and built the schooner *Enchantress*, the winner of the King's cup. He was the designer also of a number of the largest steamboats sailing out of New York harbor, among them the *Richard Peck*, *City of Lowell*, *Chester W. Chapin*, etc. In his early days Mr. Smith studied marine painting and painted pictures of many noted yachts. He was a member of the American Society of Naval Architects and Marine Engineers.

SMITH, HANNAH WHITALL. An American quakeress and philanthropist, died May 1, 1911. She was born in Philadelphia in 1832 and was educated in the famous Quaker school of Miss Mary Anna Longstroth. In 1851 she married Robert Pearsall Smith, who was also a Quaker. For a number of years she conducted Bible classes for women in Philadelphia and her home became a rallying point for religious move-

ments. In 1873-4 Mr. and Mrs. Smith went to England to hold religious conferences in several cities, which were attended by hundreds of men and women and eminent clergymen of every denomination and nationality. In 1888 she removed with her family to London, where she lived the remainder of her life. She became one of the most prominent religious leaders in England and one of the most notable women speakers and reformers of the day. She was for many years secretary of the British organization of the Woman's Christian Temperance Union and was closely allied with the English woman suffrage movement. She wrote many books and tracts on religious subjects which went through a number of editions.

SMITH, HOKE. United States senator (Democrat) from Georgia. He was born in 1855 at Newton, N. C., and received his education chiefly from his father, Dr. H. H. Smith, who was a professor in the University of North Carolina. While teaching school he studied law and was admitted to the bar. He was engaged in active practice for thirty years at Atlanta. In 1887 he became proprietor of the *Atlanta Journal* and held this property until 1898. From March 4, 1893, to September 1, 1896, he was Secretary of the Interior in the cabinet of President Cleveland. He was governor of Georgia from July, 1907, to July, 1909, but was defeated for reelection by Joseph E. Brown. In 1910 he in turn defeated Governor Brown, but before the expiration of his term of office was chosen United States senator to succeed Senator Clay. He declined to take his seat in the Senate until the expiration of his term as governor of the State. See GEORGIA.

SMITH, JAMES ROE. An American physician and soldier, died February 11, 1911. He was born in Sackett's Harbor, N. Y., in 1821, and graduated from the University of Michigan in 1848. He studied medicine and took his degree from the University of Buffalo in 1853. There were no notable changes in the faculty during the United States army and served in the West and Southwest until the outbreak of the Civil War, when he was captured by the Confederates at San Antonio, Tex., while on duty there. Upon being paroled he was assigned to duty organizing hospitals and in 1862 was appointed acting surgeon-general by President Lincoln. He later became medical director of the Seventh Army Corps and was brevetted. After the war he served as chief surgeon in various departments of the army. He was retired in 1895 as assistant surgeon-general and medical director of the Department of the East. In 1904 he was made brigadier-general.

SMITH COLLEGE. An institution for the higher education of women at Northampton, Mass., founded in 1875. There were enrolled in the various departments of the college in 1911-12, 1511 students, and the faculty numbered 138. There were no notable changes in the faculty during the year, and no noteworthy benefactions were received. The productive funds amounted to \$1,216,768, and the income to \$75,873. The library contains about 35,000 volumes. The president is Marion Le Roy Burton, D. D.

SMITHSONIAN INSTITUTION, THE. A learned institution in Washington, D. C., established in 1846 under the terms of the will of James Smithson of England, who bequeathed his fortune "to the United States of America, to found at Washington, under the name of the

Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men." The institution is independent of government control in its general administration, though founded on a private benefaction by Congress in the name of the United States. It is broadly international in its scope. Its principal activities are (1) to increase knowledge by stimulating and aiding men of talent, in America and elsewhere, to make original researches; (2) to diffuse knowledge by publishing the results of original researches or other important scientific investigations and activities, and by distributing these publications to libraries throughout the world, as well as to interchange such works, together with the publications of other learned institutions and societies, between all civilized countries; (3) to gather in Washington a library of memoirs and transactions of all learned societies, and the most important scientific periodicals, for the use of scholars; (4) to administer the United States National Museum (q. v.), including the National Gallery of Art; the Bureau of American Ethnology; the National Zoölogical Park; the Smithsonian Astrophysical Observatory; the International Exchange Service (for publications); and the Regional Bureau for the United States of the International Catalogue of Scientific Literature.

ANTHROPOLOGICAL INVESTIGATIONS. For more than 60 years the institution has been actively engaged in archaeological and ethnological researches in North and Central America, and during the last 30 years, through its Bureau of American Ethnology, it has carried on an exhaustive study of American Indians. (See **ANTHROPOLOGY**.) In 1911 the bureau conducted various lines of field work among the tribes which composed the Creek confederacy of the Southern States; the Tewa Indians of the Rio Grande Valley, New Mexico; the Winnebago Indians of Wisconsin and Nebraska; the Piegan, Blackfeet, Cheyenne, and Menominee Indians of the Algonquian family; the Chippewa Indians, especially with reference to their music; the Osage Indians, now in Oklahoma, and the Iroquois in New York. A study of the past and present population of the Indians, with the various causes of their decrease, is being conducted.

BIOLOGICAL WORK. Among important biological researches conducted by the institution in 1911 may be mentioned (1) a biological survey of the Panama Canal zone for the purpose of securing natural-history collections from that region and to determine exactly the geographical distribution of the various organisms inhabiting the Isthmus, which is one of the routes by which the animals and plants of South America have entered North America and *vice versa*. When the Panama Canal is completed the organisms of the various watersheds will be offered a ready means of mingling together, the natural distinctions as regards distribution now existing will be obliterated, and the data for a true understanding of the fauna and flora will be permanently out of reach. A great fresh-water lake will be created by the construction of the Gatun dam, and the majority of animals and plants inhabiting that locality will be driven away or drowned, and quite possibly some species may be exterminated before they become known to science. (2) A party of Smithsonian naturalists accompanied a Canadian expedition

engaged in a topographical survey of the British Columbia and Alberta boundary line and the Mount Robson region. The party started in June, 1911. The region visited is a most rugged and broken country in the midst of the Canadian Rockies, containing a great variety of animals and plants, and the naturalists secured a large and valuable collection of birds, mammals, insects, and plants to be added to the National Museum series. (3) A Smithsonian naturalist accompanied Mr. Paul J. Rainey on a hunting trip to the north of the region visited by the recent Smithsonian African expedition, through the country lying between the northern portion of British East Africa and the southern part of Abyssinia, and considerable material of importance has already been received. (4) Bird studies in the Aleutian Islands and Bering Sea were made during the summer of 1911.

GEOLOGICAL WORK. The geological researches by the institution during the year 1911 were confined chiefly to a continuation of field work by Secretary Walcott in the Cambrian strata of the Canadian Rockies, especially at Mount Stephen. The fossils gathered in that region have proved to be the most abundant and most remarkably well-preserved of any discovered in America, and equal to any in the world.

PUBLICATIONS. During 1911 the institution and its branches issued a total of 173 new publications aggregating about 9000 pages of text and 600 plates of illustrations. There were distributed during the year a total of 200,000 copies of various publications. The new works included the Langley Memoir on Mechanical Flight, a quarto book of 300 pages and 100 plates, presenting a detailed account of the experiments by Professor Langley from 1887 to May, 1896, when he demonstrated to the world the ability of a model machine heavier than air to fly under its own motive power, and his later experiments with a man-carrying aerodrome, ending in the year 1903. Other new publications related to all branches of natural and physical science.

NATIONAL MUSEUM. The United States National Museum is the legal depository of the national collections. It is especially rich in the natural history of America, including zoölogy, botany, geology, paleontology, archaeology, and ethnology, and has unique collections of American history, as well as many series relating to fine arts and the industrial arts. It is a museum of record, research, and education, and issues numerous technical and popular scientific publications. The most important item of interest in connection with the museum during 1911 was the completion of all structural work of the new building, just six years after the excavations for the foundation were commenced. It is a building massive and imposing in appearance and admirably adapted for museum purposes. It is well lighted. More than one-half of the 10 acres of floor space is placed at the service of the public in the interest of popular education, while the remaining space is used for reserve collections and laboratories of the scientific departments and divisions and for the maintenance of the building and the operation of the heating, lighting, and ventilating plant. The great exhibition halls of the new building will afford opportunity for the proper display of the national collections illustrative of natural history, and especially such large and striking objects as groups of mam-

mals, skeletons of fossil vertebrate animals, and groups representing the habits and customs of the races of mankind. The accessions received by the museum during 1911 included more than 200,000 specimens of animals and plants, besides 6000 specimens relating to geology and paleontology, and about 17,000 anthropological objects.

ASTROPHYSICAL OBSERVATORY. The Smithsonian Astrophysical Observatory investigates solar radiation and other solar phenomena, and has produced a chart, made by automatic and trustworthy processes, which shows in detail the so-called invisible infra-red spectrum. The work of this observatory is especially directed to making exact measurements of the quantity of the energy of the sun and the effects of the earth's atmosphere in diminishing the quantity available for warming the earth's surface and promoting plant growth. Observations made in 1911 tend to confirm the conclusion that the sun's output of radiation varies from day to day in a manner irregular in period and amount. The definite determination of the laws governing the apparent variability of the "solar constant," it is expected, will be of much value in the probable forecast of climatic conditions from year to year. Measurements have also been made of the transparency, for long wave radiation, of columns of air containing known quantities of water vapor. This line of research promises highly interesting results. Arrangements have been made with several observatories, widely separated through the world, for the use of the standardized silver-disk secondary pyrheliometers, designed by the director of the Smithsonian Astrophysical Observatory. It is hoped thus to secure not only uniformity of radiation measures, but also a more exact knowledge of solar radiation and the influence of the terrestrial atmosphere upon it.

The officers of the institution are Charles D. Walcott, secretary; Richard Rathbun, assistant secretary in charge of the United States National Museum; Frederick W. True, assistant secretary in charge of library and exchanges.

SMOKE PREVENTION. The campaign against unnecessary smoke in cities is being continued in many parts of the United States, by public and private agencies. Most cities which are engaged in the work entrust it to a special department. In New York City the suppression of smoke from the burning of coal and also from automobiles in the city streets is in the control of the department of health, but elsewhere this work does not appear to be regarded as a health-protective function.

Pittsburgh, Pa., passed an ordinance in September, 1911, regulating the emission of smoke from chimneys, locomotives, steamboats, and motor vehicles, providing for a chief smoke inspector and deputy inspectors, establishing smoke standards and providing penalties for violations of the ordinance. No steam boiler or other furnace (except in the case of residences, mill-heating furnaces, and puddling furnaces) can be constructed without filing plans with the chief smoke inspector for the furnace and chimney and indicating means for preventing objectionable smoke. Provisions for the inspection of smoke-producing plants are made. Dense black or dense gray smoke, except for eight minutes within any one hour, is prohibited, and the Ringleman smoke scale, as provided by the

United States Geological Survey, is made standard.

LOCOMOTIVE SMOKE AND RAILWAY ELECTRIFICATION IN CITIES. In many cities a large percentage of the most troublesome smoke comes from railway locomotives. This has led to agitation to compel the railways of some other cities to follow the example of the railways which penetrate New York, by substituting electricity for steam as a motive power. The Massachusetts legislature of 1910 ordered the railways entering Boston to make studies for the electrification of their lines and to submit the studies to a joint board on Metropolitan improvements, which was in turn to report to the legislature. This board submitted a voluminous report, with many data, on January 30, 1911. (The reports in behalf of the railways were abstracted briefly in the *Engineering News*, New York, for December 8, 1910, and lengthy extracts from the report of the board were published in the same journal on February 2, 1911.) A majority of the board (nine members) reported against compulsory electrification, stating that while electrification would add to the comfort and convenience of the public and would have some advantages for the railways, yet it would be undesirable for both the public and the railways, on account of the incomplete state of the art, the higher cost of moving trains by electricity than by steam, and the resulting necessity for increasing rates and for postponing other improvements. At the same time the majority stated that electrification would probably come in the future on through lines as well as at terminals. Seven members of the board, including all the members of the State railroad commission, dissented from the majority report. Of these five believed that electrification was practicable and desirable, while two believed the subject should receive further study.

The results of a Chicago study of the part played by the railways in smoke production in that city was summarized in February, 1911, in a paper read before the Western Society of Engineers by Paul B. Bird, chief smoke inspector of Chicago. (An abstract of the paper appeared in the *Engineering News* for March 2, 1911, and the full paper was published later in the *Journal* of the society). Mr. Bird concluded that although the locomotives operating in Chicago use only 18½ per cent. of the coal consumed in that city, yet they produce 43 per cent. of the smoke and over 50 per cent. of the dirt from coal. He also concluded that "electrification offers the only final and satisfactory solution of the locomotive smoke problem." The Chicago Association of Commerce organized a commission on smoke abatement and electrification in 1911, which included four men appointed by the mayor of the city together with representatives of the railway and general business interests of the city. A review of the history of efforts at smoke abatement in Chicago since 1881, including the work of the committee just named, to the close of 1911 was submitted to the Association of Commerce at the close of the year. The report was made by the chief engineer of the commission, Horace G. Burt, a former president of the Union Pacific Railroad (see *Engineering News*, January 11, 1912, for lengthy abstract of report).

STUDIES IN CLEVELAND. Among the private organizations which have been studying the

smoke problem is the chamber of commerce of Cleveland, O. After three years' study as chairman of the smoke prevention committee of that organization, Mr. E. P. Roberts, a Cleveland engineer, stated in September, 1911, that data secured from a house-to-house canvass indicated that the smoke damage to shelf goods in stores and to house furnishings in Cleveland averages \$12 per capita per year.

A DIVISION OF SMOKE INVESTIGATIONS has been started by the department of industrial research of the University of Pittsburgh, Pa., under the direction of R. C. Benner and W. W. Strong. A scientific study will be made of the effect of smoke on the health of human beings and plants, on buildings, and on the cost of living.

The International Association for the Prevention of Smoke discussed various phases of the problem at its annual convention held in Newark, N. J., in June, 1911. The Coal Smoke Abatement Society of England is conducting an anti-smoke campaign in that country. Late in 1911 it arranged for an International Coal Smoke Abatement Exhibition, to be held in the Royal Agricultural Hall, Islington, London, England, March 23 to April 4, 1912.

SOCIALISM. SOCIALISTS AND WAR. The strained relations between France and Germany and Great Britain and Germany and the outbreak of the war between Italy and Turkey led to important demonstrations of the attitude of the Socialists toward war during the year. Soon after Germany sent the *Panther* to Agadir (see MOROCCO) French and German representatives of the trades unions met at the office of the *Neue Welt* in Berlin, and the orators on that occasion (July 28) were profuse in their assertions of international solidarity and of the need of preventing war by all possible means. The fact that this meeting was held under trades union and not Social Democratic auspices led to criticism of the German Social Democracy for not having taken the initiative and for not calling upon the International Socialist Bureau at Brussels to organize a movement for international peace. But Herr Bebel, the leader of the Social Democratic party, declared that the time was not opportune for such a course and that care should be taken not to offend the national sentiment. Nevertheless, there were important Socialist peace demonstrations in several of the large German cities. In September a great demonstration was held as a protest against war between France and Germany at Treptow Park near Berlin. Peace meetings of Socialists were also held during the year in London, Paris, Toulouse, Barcelona, and other European cities. For an account of the official attitude of the German Social Democrats toward the Moroccan question as shown in the debates in the Congress of Jena, see MOROCCO. Opinions were divided. Some upheld the government's course in Morocco, but urged that all possible efforts should be made to come to an *entente* with France. Herr Bernstein gave strong expression to that point of view. He declared that in spite of the good intentions of the French working classes, their threats of strikes and of violent direct action in order to avert war were not likely to come to anything. This had been shown by the ready submission of the French railway men in 1910 when the application of the military code by the Briand

ministry had brought to a close a movement that seemed almost revolutionary. It was of no use to agitate against war without a settled policy. He said the German Social Democrats opposed the French policy of encroaching in Morocco, and then bargaining with Germany for a free hand, and that they did not blame the government for not quietly looking on while France, in violation of the act of Algeciras, seized powers in Morocco that would give her a commercial monopoly. He held that it was right to insist on the observance of treaties and that it was not right for Germans to champion the cause of foreign powers in conflict with their own country. The proper and only course for Germany was to insist on the enforcement of the act of Algeciras. As to Great Britain, she had no right to permit France to violate that agreement and then call Germany to account for her course at Agadir.

In France the Socialists have always favored an *entente* with Germany, and when the Moroccan affair came up the organ of the French Socialists, *L'Humanité*, laid strong emphasis on the need of a Franco-German accord, declaring that hostility between the two nations menaced the cause of European civilization. On the outbreak of the Turco-Italian war there were many Socialist demonstrations on behalf of peace. In Germany the leaders of the party declared that all efforts should be made to maintain the international solidarity. In Italy, where the war was very popular, many Socialists shared in the prevailing imperialism. At the Socialist congress at Modena, October 15, opinions were divided, but later (December 4) the committee of the congress unanimously condemned the war. In the Italian Chamber the Socialist party was split in two over the question, those condemning the war having a majority of only one over those who deprecated any course of action that would embarrass the government. In general, the Italian Socialists were divided on the question, and their opposition was ineffective. In Great Britain the small group of Socialists, known as the Social Democratic party, seemed, despite its German origin, to be distinctly hostile to Germany, and a resolution offered by its leader, Mr. Hyndman, was voted, declaring that the party ought to support the government in the maintenance of an adequate fleet. This action was criticised by continental Socialists as hostile to the spirit of international socialism. If divisions along national lines prevailed what, they asked, would become of that simultaneous action in the event of war which had been urged by Socialist leaders at the great international congresses? At the Birmingham congress of the Labor party, however, a prominent speaker declared that an *entente* between Germany and England was more important than an *entente* between England and the United States. In general, the demonstrations of the Socialists against war, though designed to prove their harmony on that subject, did not have that effect. Sharp lines of division, based on national sentiment, were revealed.

GERMANY. The Social Democratic party, which in Germany is distinctly a party of the people, and apart from its specific socialist doctrines attracts many supporters by its progressive and democratic appeal, showed remarkable gains during the year, and the prospects of the Social Democrats in the approaching elec-

tions of January, 1912, were very favorable. The membership of the party increased from 720,038 in 1910 to 836,562 in 1911. The latter figure included 107,693 women. As the elections of January drew near the question of political alliances arose. Herr Bebel favored alliance with other parties on the second ballot if they pledged themselves to the following programme: Support of universal suffrage and opposition to any restriction of association and meeting, as well as to the laws of exception, to customs duties and taxes affecting the workingman's subsistence, and to the political paragraphs of the penal code. See GERMANY, *History*, and MOROCCO, *History*.

FRANCE. This constantly recurring question of political alliances also agitated the French Unified Socialists in their congress at St. Quentin at Easter. Although syndicalism and Hervéism were no longer so menacing to party unity as formerly, there were still the lines of cleavage between the three groups represented respectively by the opportunist Jaurès, the orthodox Marxist, Guesde, and the revolutionary Blanquist, Vaillant. The Seine federation demanded that there should be no alliance with any other political party on the first ballot and that on the second ballot the Socialists should merely withdraw their candidates if their election seemed impossible. This demand was rejected by the congress by a large majority, which declared for a "return to Republican discipline," and condemned alliances with the Right, but authorized alliances on both the first and second ballots with the Republicans of the Extreme Left. As to the participation of Socialists in a bourgeois ministry, M. Jaurès, who was believed to favor such a course, was not supported by the congress. M. Vaillant declared without contradiction that there was no longer any "ministerialism" in the party, since the Amsterdam congress had decided that question, and that not only the older and orthodox elements of the party were opposed to it, but even the younger members. An extraordinary session of the party was held at Paris on November 2. The attempt of the Guesdists on this occasion to substitute a centralized system for the present federal organizations of the party was unsuccessful. In general, the year was marked by dissensions within the party itself and by the continuance of its attacks upon the syndicalists and especially upon the General Federation of Labor. As a result of the elections of 1910 the Unified Socialists held 76 seats in Parliament. Their vote in that election had been 1,106,017, an increase of 20 per cent. over the vote of 1906. But it was pointed out that their gains in Parliament had been due in part to the votes of the Right and to partisans of proportional representation, and that the increase in the number of enrolled members was by no means so great. In that respect there was a marked contrast between the French Socialists and the Social Democrats of Germany. In the latter country there was an enrolled member for every four electors. In France there was an enrolled member for every fifteen. The customary May Day celebration drew enormous crowds, which showed a disorderly temper and came into conflict with the troops and police. About fifty citizens were injured and one hundred arrests made. About fifty of the police were said to have received injuries.

GREAT BRITAIN. In Great Britain the Socialists are organized in two groups, of which by far the most important politically is the Independent Labor party, with about 60,000 members and comprising the Socialist element in the Labor party. The other organization, known as the Social Democratic party, with Mr. Hyndman at its head, has about 18,000 members. It is doctrinaire in temper and does not participate in politics. It is formed on the model of the German social democracy, but with strictly Marxist doctrines. Its attitude toward war has been mentioned in the above paragraph. An important development in 1911 was its decision to join with certain minor Socialist bodies and form a new organization to be known as the British Socialist party. This followed a conference at Manchester, to which all Socialists were invited and which was said to represent a constituency of 35,000, but neither the Independent Labor party nor the Fabian Society was officially represented. The most prominent figure in the new movement was Mr. Victor Grayson. Its principal object was the amalgamation of all groups which stood for revolutionary, independent socialism.

The Independent Labor party held a congress at Leicester in the beginning of February. Mr. Keir Hardie's proposal for a general strike was voted down. A meeting was held at Birmingham on April 6, at which the question of Parliamentary action was discussed. Mr. Ramsay MacDonald declared that it was the duty of the party to bring pressure to bear upon the ministry without, however, playing into the hands of the Conservatives. On the other hand, Mr. Keir Hardie contended that compromises were dangerous and that the party must be ready to attack the ministry if the latter confined itself to mere reform of the House of Lords. The congress decided that in general the party must take an independent course in Parliament, the Liberals being no less the enemies of socialism than the Opposition.

ITALY. The offer of the portfolio of agriculture in the Giolitti cabinet to Signor Bissolati on March 18 (see ITALY, *History*), caused much discussion in socialist circles, recalling the debate which formerly raged over the question of M. Millerand's presence in the Waldeck-Rousseau cabinet in France some years before. Signor Giolitti's programme included, in addition to electoral reform, important social and fiscal measures of amelioration, and its policy was distinctly anti-clerical. Despite its harmony in some respects with socialistic aims, the idea of Signor Bissolati's acceptance was very repugnant to leaders of the party throughout Europe, the *Vorwaerts*, and other Socialist organs, declaring that it was a violation of the decrees of the international congresses of Paris and Amsterdam, and that it would tend to divide Socialists and to confound their policy. In view of these criticisms Signor Bissolati refused the offer, alleging that he could not submit to a certain official ceremony at court. He held, however, that eventually Socialists would have to participate in Italian governmental affairs. The opinion of his colleagues was divided.

BELGIUM. The important event in the history of the Belgian movement during the year was the alliance with Liberals. At their Easter meeting, at which 500 delegates were present, they discussed trade unionism, the propaganda for universal suffrage, and the best means of

opposing the government's School bill. The meeting resulted in an alliance with the Liberals. (See *BELGIUM, History*.) A Marxist minority broke off, however, and founded a journal, which attacked the Liberal-Socialist bloc and denied the right of a Socialist to accept a cabinet office.

THE NETHERLANDS. At the regular annual meeting of the Dutch Socialists in the spring a movement was started under M. Troelstra on behalf of universal suffrage, male and female. It was proposed that a petition should be presented and that if it were not received a demonstration should be organized in its behalf both in Parliament and among the people. But neither the funds for the movement nor the signatures to the petition were forthcoming, and though the plan stirred the enthusiasm of the congress, it aroused little interest outside, owing perhaps to the belief that every extension of the suffrage had, as a matter of fact, redounded to the advantage of the conservative element.

FINLAND. The Socialists again secured an increased majority of votes in the 1911 elections for the Diet. See *FINLAND, History*.

SWEDEN. As a result of the general election of October, 1911, the Socialist representation in the lower house was about doubled, and they elected four senators. They refused to join with the Liberals in forming a coalition ministry. See *SWEDEN, History*.

AUSTRIA-HUNGARY. Race problems continued to divide the Socialists as well as the trade unionists of Austria. In the elections of June 14 to the Reichsrath the Socialists secured eighty seats, seven less than before, but they scored a great success over the Christian Socialists. The rank and file of Czech Socialists and trade unionists rebelled against the control of their respective party and trade organizations by German Jews in Vienna. As to the Hungarian Socialists, they formed a group apart, preoccupied with their demand for universal suffrage. They addressed a petition on that subject to the king. See *AUSTRIA-HUNGARY, History*.

THE UNITED STATES. Socialistic successes in the United States during the last two years, though in the main local and though often confused with other issues, nevertheless proved a great advance in the movement as a whole. A low estimate of the number of Socialists holding office in the United States in 1911 before the November elections placed it at 435, representing 33 States and about 160 municipalities. About one-half of these held important legislative or municipal positions, including 1 congressman, 1 State senator, and 16 State representatives. The predominant strength of the party was in the Middle West, and the leading State, both in respect to the number of Socialists elected and in respect to the number of communities that elected them, was Wisconsin, Milwaukee alone having over one-eighth of the total number of Socialists in office. Other leading States were Illinois, Minnesota, Michigan, Missouri, Iowa, North Dakota, Kansas, and California. More than half the Socialists in office were from small cities, villages, and townships. The Socialist successes were, for the most part, sporadic and arose from the particular circumstances of the locality, such as the personal characters of the candidates, the corruption attributed to the regular parties, questions of liquor-law enforcement, specific cases of public

ownership, etc. It could not be explained by any single cause or set of causes, and above all it did not indicate the triumph of the extreme doctrinaire type of socialism, but rather of the moderate and opportunist type. Prof. Robert F. Hoxie, on whose careful study of the movement in the *Journal of Political Economy*, for October, 1911, the above statements are based, concludes that "effective socialism in this country is at present a young, vigorous, and very protean movement, for the most part moderate, liberal, honest, and above all essentially democratic. What mainly differentiates it from the democracy of the crowd is that it rests on an evolutionary philosophy rather than on the classical eighteenth-century absolutistic, natural-rights doctrine. It differs from the democracy of the up-to-date reformers in being somewhat more youthfully vigorous and thoroughgoing." The Milwaukee elections of 1910 undoubtedly gave the movement a great impetus. Since the Milwaukee victory the numerical strength of the party is reported to have nearly doubled. For further details, see the articles on the separate States and on the UNITED STATES, paragraphs on *Politics, Elections, History*, etc.

SOCIAL REFORM. See *SOCIOLOGY*.

SOCIAL PHILOSOPHY. See *PHILOSOPHY*.

SOCIAL SERVICE, AMERICAN INSTITUTE OF. Founded in 1898. Object: The gathering and disseminating of information on all branches of social thought and service. It supplies information and advises as to methods by correspondence, its publications, lectures, and its special reference library being open to the public. Its service is free, except when special investigations are required. *The Gospel of the Kingdom*, published monthly by the institute (50 cents per year), contains studies in the application of Christian principles to present-day problems, which are now used by 500 classes in churches, Y. M. C. A.'s, etc., in the United States and Canada. These studies appearing first in the *Homiletic Review* and then with additional material in *The Gospel of the Kingdom* reach some 40,000 readers.

The institute has been a pioneer in many social movements and in educating public opinion as to needed social activities. It has led to the formation of similar organizations in Sweden, Great Britain, Denmark, Italy, Spain, Australia, and Russia, and has collaborators in these and other countries. Officers: President, Dr. Josiah Strong; lecturer, Dr. James H. Eeob; treasurer, John T. Perkins, Astor Place Bank. Headquarters: Bible House, Astor Place, New York.

SOCIETY OF CHEMICAL INDUSTRY OF GREAT BRITAIN. See *CHEMISTRY, INDUSTRIAL*.

SOCIOLOGICAL SOCIETY, AMERICAN. See *SOCIOLOGY*.

SOCIOLOGY. **THE AMERICAN SOCIOLOGICAL SOCIETY.** The sixth annual meeting of this society was held in Washington, D. C., December 27-30. The presidential address by Prof. F. H. Giddings of Columbia University was on the Quality of Civilization. He emphasized the need of social solidarity, which our complex ethnic composition made difficult of attainment. He, however, laid stress on certain factors in assimilation in American life, which would bring about a true solidarity of thought and feeling in the American population. These fac-

tors are the standardization of consumption, the scientific view of nature, and the interest in social justice. The first topic of discussion was the city as a socializing agency. Dr. F. C. Howe of New York City discussed the City Plan, Prof. H. P. Woolston of the College of the City of New York discussed the Urban Habit of Mind, and Mr. Paul U. Kellogg of *The Survey*, the City and Industrial Cleavage; Miss Jane Addams of Hull House, Chicago, spoke on Recreation as a Public Function in Urban Communities, and Mr. C. W. Hetherington discussed Recreation in Rural Communities. Both speakers laid stress on the value of recreation as a school for true democracy. Selection of Population by Migration was discussed by Prof. H. P. Fairchild of Yale University, Prof. Walter F. Willcox of Cornell University, Prof. J. W. Jenks of the Immigration Commission, Prof. Emily Balch of Wellesley University, and others. Professor Fairchild discussed the objectionable features of immigration and the remedies proposed. Professor Willcox minimized evils of immigration and pointed out that it is cheaper to import people than it is to rear them. Professor Balch favored the coming of immigrants under contract, provided they were protected by the government in making such contracts, advocated a general minimum wage for all immigrants, and declared the literacy test stupid. Professor Ross impressively presented the outcome of the present substitution of cheaper labor and the consequent introduction of lower standards of living. He pointed out that the English, Scotch, German, and Scandinavian laborers have practically ceased to come; that the Italians will give place to Slavs, Greeks, and Armenians, who in turn will be followed by Afghans, Hindus, and other Asiatic coolies, until a complete equalization of labor conditions here and in Asia has been established. A committee previously selected to inquire into the subject matter for a course in sociology submitted its report. The following officers were elected for 1912: President Albion W. Small, Chicago University; vice-presidents, E. A. Ross, University of Wisconsin, and George E. Vincent, president of the University of Minnesota; secretary-treasurer, Scott E. Bedford; additional members of the executive committee were Charles Cooley, Prof. J. P. Lichtenberger, and Emily Greene Balch.

BIBLIOGRAPHY. Among the books issued in 1911 bearing upon sociological problems and sociological theory may be mentioned: *The Social Basis of Religion*, by Simon N. Patten; *Woman and Labor*, by Olive Schreiner; *Greek Immigration to the United States*, by Henry Pratt Fairchild; *Racial Decay*, a compilation of evidence from world sources, by O. C. Beale; *La dépopulation de la France*, by J. Bertillon; *The Immigration Problem*, by J. W. Jenks and W. J. Lauck; *The Mind of Primitive Man*, by Franz Boas; *Le conflit de la morale et de la sociologie*, by Simon Deploige; *Black and White in South-East Africa*, by Maurice Evans; *The Race Conflict*, by W. P. Livingstone; *L'uomo secondo le origini l'antichità, le variazioni e la distribuzione geografica*, by G. Sergi; *Papers on Inter-Racial Problems Communicated to the First Universal Races Congress*, July 26-29, 1911, G. Spiller (ed.); *Die Urgeschichte des Menschen*, by H. Tuschlag; *Half a Man; the Status of the Negro in New York*, by Mary W. Ovington; *Marriage, Totemism, and Religion*, by J. L. Ave-

bury; *Origin of Civilization*, by the same; *Dawn of Mediterranean Civilization*, by A. Mosso; *Man-Made World, or Our Androcentric Culture*, by C. P. Gilman; *Transition to an Objective Standard of Social Control*, by L. L. Bernard; *Sociology Applied to Practical Politics*, by J. B. Crozier; *Christianizing the Social Order*, by Walter Rauschenbusch; *Social Evolution and Political Theory*, by G. T. Hobhouse; *Morality of Women*, by Ellen Key.

SOCIAL REFORM. One of the growing characteristics of our day is the increased attention given to plans for social betterment. These plans cover a wide range of industrial and social life, and many of them are still in the experimental stage. The following books are among the most important and suggestive in the new lines of these investigations: *Legal Doctrine and Social Progress*, by Frank Parsons; *Social Pathology*, by S. G. Smith; *Industrial Causes of Congestion of Population in New York City*, by E. E. Pratt; *Housing of Working Class*, 3d ed., by Allen; *Juvenile Labour Exchanges and After-Care*, by A. Greenwood; *The Almshouse; Construction and Management*, by Alexander Johnson; *One Thousand Homeless Men: A Study of Original Records*, by Alice Willard Solenberger; *Industrial Coöperation in Bristol*, a study in democracy, being an account of the rise and progress of industrial coöperation in Bristol, by Edward Jackson; *Socialism and Individualism*, by Sydney Webb and others; *The Vocational Guidance of Youth*, by M. Bloomfield; *The Social Engineer*, by E. L. Earp; *The New Social Democracy*, by J. H. Harley; *Ferdinand Lassalle*, by G. Brandes; *Social Adjustment*, by Scott Nearing. See also lists of books under **WORKINGMEN'S INSURANCE**, **PENOLOGY**, and **WOMEN IN INDUSTRY**. See **PHILOSOPHY**.

SOIL ORGANISMS. See **BOTANY**.

SOILS. The year 1911 was one of marked progress in soil surveying and in the study of the exact composition, properties, bacterial activities, adaptations, and management of soils.

SOIL SURVEYING. The United States Bureau of Soils completed during the year 60 soil surveys in 21 States, aggregating a total area of 95,420 square miles, of which 25,096 square miles was mapped in detail, and 70,324 square miles in a broader, more general way on the basis of reconnaissance surveys. The total area surveyed and mapped by the bureau to date in the United States is over 500,000 square miles. While such work was most active in the United States, it also received considerable attention in other countries. A. D. Hall and his colleagues completed and reported an elaborate survey of three counties, Kent, Surrey, and Sussex, of southeastern England. Notable progress in similar work was reported from Australia and South Africa, although not on the systematic plan followed in the United States.

The value of soil surveys as a basis for selection and adaptation of crops and for further experimental study of soils is now widely recognized, and such surveys have become sufficiently extensive to be useful for this purpose, especially in the United States, where in a few States as much as half the area has been mapped and in many others from a fourth to a third has been covered. The areas surveyed therefore furnish a good basis for the series of publications which has been begun by the Bureau of Soils on the use, limitations, and possibilities of the important soil types of the United States.

SOIL CONSERVATION A QUESTION OF NATIONAL WELFARE. That questions of soil conservation, which can only be answered fully by means of accurate soil surveys and studies, are actively engaging public attention and are recognized as of great national importance is shown by the prominence given to the discussion of such questions at the Conservation Congress at Kansas City, Mo., September 25, 1911, where the subject was elaborately discussed by the President of the United States; Henry Wallace, president of the congress; ex-Governor Hoard of Wisconsin, and others. The President was optimistic and predicted that by 1960 methods of soil conservation and management will have so far advanced that the United States, with a population of 200,000,000, "will still continue to feed her millions and feed them well out of her own soil." The other speakers were less optimistic, deploring the soil-robbing methods which still so widely prevail among American farmers, and calling attention sharply to the fact that notwithstanding the great effort which has been made to introduce better methods of farming, production has not yet overtaken consumption in the United States, and there has been no marked increase in the average productive capacity per acre of American farm lands. That soil investigation is now receiving much attention on the scientific side was evidenced by the prominence given to this subject at the Washington meeting of the American Association for the Advancement of Science in December, 1911.

STUDY OF THE ORGANIC MATTER OF THE SOIL. In the scientific studies of soils reported during 1911 the most important advances noted were in the knowledge of the composition and properties of the organic matter of the soil and of the relation of the activities of micro-organisms to soil fertility. Heretofore the inorganic or mineral constituents of soils have received more attention than the organic constituents, with the result that our knowledge of the mineral matter is more complete than that of the organic matter or so-called humus.

During 1911 Schreiner and his associates of the Bureau of Soils reported the isolation and study of a large number of definite organic compounds derived from soils, some toxic, some beneficial. Jodidi, Patten, and others also reported investigations which go far toward completing our knowledge of the important nitrogenous compounds of the soil.

These investigations on the organic matter of the soil have an important bearing on the bacterial activity of the soil, since the organic matter furnishes the chief food of the soil organisms, and knowledge and control of the organic matter of the soil will no doubt enable us to control in large measure the activities of the soil organisms.

SOIL STERILIZATION AND SANITATION. Further studies on soil sterilization have emphasized certain important phases of both coöperative and antagonistic relations of various groups of soil organisms. A continuation of investigations at Rothamsted has given results which appear not to bear out the theories previously enunciated, and referred to in last year's review, regarding the possible power of protozoa to limit the action of beneficial ammonia-forming bacteria. These later investigations have shown that at least one important group of soil, protozoa is not active in the soil except possibly to a very limited extent at the surface, and

therefore cannot be considered as playing any important part in restricting the activities of the ammonia-forming organisms. H. L. Bolley further elaborated his theory that the beneficial effect of soil sterilization is due more to destruction of organisms causing plant diseases than to any action on chemical and bacteriological properties of the soil. These investigations have at last made it plain that a fertile soil is not a dead, inert mass but a living thing.

NEW SOIL JOURNAL. The year 1911 was marked by the beginning of the publication of the first scientific journal devoted exclusively to the soil—*Internationale Mitteilungen für Bodenkunde*—under the editorship of G. Murgoci, E. Ramann, and F. Wahnschaffe, with a large list of collaborators prominent in soil investigation in different countries. This journal was established in response to a resolution of the International Agrogeological Congress, to which reference was made in last year's review, and is intended to be international in scope.

GENERAL CONCLUSIONS. In general it may be said that progress in soil investigations during 1911 was along lines noted in previous reviews, which have enlarged our knowledge, especially as to the physical, chemical, and biological properties and processes which go to determine soil fertility. The work in 1911 emphasized particularly the important functions which certain hitherto disregarded soil constituents and nitrogen-fixing and transforming organisms play in soil productiveness.

LITERATURE. Important contributions to the literature of soils during the year were a *Bibliography of Eolian Geology*, especially as related to movement of soil material, by S. C. Stuntz and E. E. Free, which appeared as Bulletin 68 of the Bureau of Soils; and *The Soil Solution*, by F. K. Cameron.

SOLEY, JAMES RUSSELL. An American lawyer and author, died September 11, 1911. He was born in Boston in 1850 and graduated from Harvard College in 1870. Following his graduation from Harvard he became assistant professor of English at the United States Naval Academy. While there he studied law and was admitted to the bar in Washington. In 1873 he was made head of the department of law and history at the Naval Academy. He shortly afterwards made a tour of inspection of the foreign naval academies for the Naval Department and in 1878 was on duty at the Paris Exposition. In 1882 he was transferred to Washington and assumed charge of the library of the navy and of the publication of the Civil War records of the army. He delivered in 1885 a course of lectures on naval history before the Lowell Institute in Boston and again in 1888 on European neutrality in the Civil War. In 1890 he was appointed by Gen. B. F. Tracy Assistant Secretary of the Navy. He removed to New York in 1893 and became a member of the law firm of Boardman, Platt & Soley. He retired from this firm some years previous to his death and practiced law independently. Mr. Soley was counsel for Venezuela at the arbitration of the boundary dispute between that country and Great Britain in 1899. He was the author of many books, including *History of the Naval Academy* (1876); *Foreign Systems of Naval Education* (1879); *The Blockade of the Cruisers* (1883);

The Boys of 1812 (1887); *Sailor Boys of '61* (1888), and *Life of Admiral Porter* (1903).

SOLUTIONS, CHEMICAL. See CHEMISTRY.

SOLUTIONS, SOLID. See MINERALOGY.

SOUTH, UNIVERSITY OF THE. An institution of higher learning, founded in 1858, at Seewanee, Tenn. The students in all departments of the university in 1910-11 numbered 205, the professors and instructors 19. The university maintains a college of arts and sciences, a theological department, a university extension department, and a preparatory school. Its property is valued at \$800,000, and its endowment at \$300,000. During the year work was begun on a science hall, the gift of Andrew Carnegie. The library contains about 35,000 volumes. Vice-chancellor, 1911, William B. Hall.

SOUTH AFRICA, UNION OF. A British dominion, occupying the southern portion of the continent of Africa, containing four provinces—the Cape of Good Hope, Natal, the Transvaal, and the Orange Free State (qq. v.). Capital, Pretoria (Transvaal).

Total estimated area, 473,184 sq. miles. Total population in 1904, 5,175,824; in 1911, 5,958,499. Imports (total Union) in 1909, £31,411,150; exports, £2,010,821. Imports 1910, £38,940,694 (merchandise, £34,007,178; government stores, £2,720,189; specie, £2,313,327); exports, £56,428,455 (colonial produce, £54,684,038; re-exports, £1,414,645; specie, £329,772). Included in the exports are diamonds and gold from Rhodesia, Congo, and Portuguese East Africa to the value of £2,489,343, a sum which is not included in the imports. Total net tonnage entered (1910), 11,494,855 (coastwise, 6,288,867; other, 5,205,988), of which 9,709,625 were British; cleared, 11,494,355 (coastwise, 6,468,636; other, 5,025,699), of which 9,725,127 British. Total railways, 7221 miles. Total revenue (1909-10), £18,144,346; expenditure, £18,143,886. Estimates (revised) for 1910-11, £14,014,000 and £13,536,000; estimates for 1911-12, £14,859,000 and £16,166,000, the deficit to be made up by £1,150,000 railway contribution. The projected cigarette duty is expected to yield £45,000. The Union began with a total debt of £116,500,000, of which £75,234,000 was for railways and harbors.

The South Africa act (1909) constituting the Union provides for the appointment of a governor-general, aided by an executive council whose members he appoints. The legislative body consists of a senate of 40 members (8 appointed, 32 elected) and a house of assembly of 121 elected. A provincial council in each province has power to legislate by ordinance on certain subjects specified in the act and on such other subjects as may be delegated to it. The provincial executive is an administrator, appointed by the governor-general in council.

The ministry in 1911 was as follows: Governor-General, Viscount Gladstone of Lanark; Prime Minister and Minister of Agriculture, Louis Botha; Minister of Railways and Harbors, J. W. Sauer; Minister of the Interior, of Mines, and of Defense, J. C. Smuts; Minister of Justice, J. B. M. Hertzog; Minister of Education, F. S. Malan; Minister of Finance, H. C. Hull; Minister of Lands, A. Fischer; Minister of Native Affairs, H. Burton; Minister of Commerce and Industries, Col. G. Leuchars; Minister of Public Works, and of Posts and Tele-

graphs, D. P. de V. Graaff; Minister without portfolio, Dr. C. O'Grady Gubbins.

HISTORY

PARLIAMENT. The first Parliament under the Union was opened on November 4, 1910, and ended on April 25, 1911. The status of political parties was somewhat indeterminate. The Dutch organizations, Het Volk, the Afrikaner Bond, and Orangia Unie had combined in the so-called Nationalist party under the leadership of the president of the new commonwealth, General Botha. The Unionist party, the chief opposition party, under Sir Leander Starr Jameson, comprised the Cape Unionists, the Orange Free State Constitutionalists, and the Transvaal Progressives. There were lesser outlying groups, including the Natal Independents, who viewed the two chief parties with suspicion, but on the whole inclined to the side of the government. As a result of the first elections, parties in the Union House of Assembly were distributed as follows: Nationalists, 67; Unionists, 37; Independents, 13; and Labor members, 4. One of the first acts of the new Parliament was a measure laying a tax of 10 per cent. on the profits of the Cape and Orange Free State mines. In the course of a speech on January 21 General Botha declared himself in favor of protection for the country as a whole, not for one part against another, and announced the intention of the government to build irrigation works on a large scale and to take measures for the promotion of closer settlement. His speech was an appeal for moderation, and he declared that it was necessary to unify the ministerial organizations of the respective provinces. The chief question before Parliament was the status of the English and Dutch languages in the schools. The matter was referred to a select committee, who submitted a majority report in favor of a compromise based on the principle that until the pupil had passed through Standard IV, instruction should be carried on in the language of the home, and that after that parents were free to choose the language of instruction. The report further recommended the provision that no English teacher shall be disqualified for ignorance of Dutch and no Dutch teacher for ignorance of English.

The third reading of the Post Office bill passed the Union Assembly on April 3. This measure was important as indicating the strong stand of the government against the shipping ring. It provided that no mail contract should be awarded to anyone who gives rebates in order to secure exclusive dealings, or who is associated with any shipping or other combination which the governor-general considers injurious to South African trade. The results of the session also included the Stock Disease act for stricter rules concerning the negligence of farmers, the Prisons act concerning juvenile delinquents and recidivists, the Mines Regulation act, the Stamp act, and important measures for the consolidation of the Union. On the other hand, little was done toward equalizing the burden of taxation and the civil service was not reorganized. Political parties continued to be divided on somewhat artificial lines, neither the government party nor the opposition showing much coherence.

THE IMMIGRATION QUESTION. The Minister of the Interior, Mr. Smuts, in the course of a

speech in the House of Assembly on February 28 paid a tribute to the staunch stand of the Indians on behalf of what they regarded as their rights. He said, however, that the checking of immigration was the government's settled policy and could alone solve the problem. After correspondence with the imperial authorities an Immigrants Restriction bill, designed to remove the most serious grievances of the Asiatics, was introduced and passed its second reading in March. The minister of the interior declared that it conformed to Lord Crewe, the imperial colonial secretary's suggestion of uniformity in immigration rules. It excluded anyone unable to write, to the satisfaction of the immigration officer, fifty words in such language as that officer chose to dictate. The minister declared this test superior to the educational test hitherto employed in South Africa, that it had worked well in Australia, and that it could be applied only against undesirable aliens. Provision was made for the admission of a limited number of educated Asiatics each year. The bill passed its second reading without a division, but was withdrawn because of lack of time for discussion. Subsequently an agreement was made with the Asiatics for the introduction of a similar measure at the next session and for the relaxation of the regulations in the meanwhile.

On May 23 General Botha announced that the difficulty over the status of the Asiatics was settled. Measures were framed in a conciliatory spirit toward the Indians. These permitted those Indians who had not registered on account of the passive resistance movement to do so if they applied within six months. A number of those who had been deported under the acts of 1907 and 1908, or who had left on account of passive resistance were permitted to return and apply within six months. It was provided that six educated Indians could come in each year without registration, and that well-known and educated Indians might be exempted from the thumb print test on application.

Meanwhile, on January 3 the Indian viceroy's legislative council had prohibited the emigration of indentured Indians to Natal after July, 1911. The effect of this was greatly to increase the rate of wages. It was estimated that the wages of natives were doubled, and those of Indians increased by 50 per cent.

THE LANGUAGE QUESTION. It was evident toward the end of the year that the premier, General Botha, definitely favored a compromise on the question of language in the schools. It became known at that time that the leaders in the Orange Free State and Natal provinces were ready to amend the education laws of their respective provinces on the basis of the compromise recommended by the select committee of Parliament. General Botha, in announcing his belief that the provincial laws would be amended to this end, declared that it would leave nothing that would tend to separate the two races. General Hertzog, who had so long been the uncompromising advocate of Dutch in the schools, and had stirred up bitter opposition, based on the principle of a compulsory use of both languages, announced in November that the Orange Free State leaders had agreed to amend the provincial education law in regard to the language question, because they believed it would promote harmony and coöperation between both races.

PARTY CONGRESSES. The Nationalist party congress was held at Bloemfontein on November 21. The object of the party, as set forth by General Botha, was to create a South African Union. Although political unity had been attained, there remained the greater task of uniting the white races into a national state. The best means of securing this end was by coöperation, and his attitude on the education question was based on that principle. As to the specific policies, he advocated plans of irrigation, land settlement, and adequate measures for military defense. The Unionist congress, which was in session at the same time at Durban, laid especial emphasis on the comprehensive plan for military defense, including a system of compulsory military training and full recognition of imperial obligations by the increase of the naval contribution.

OTHER EVENTS. The subject of defense figured largely in political discussion throughout the year. A defense scheme was outlined by Mr. Smuts, but it was opposed by Mr. Merri-man, on the ground that the best defense was proper government. It was argued that now that South Africa had become a nation, it must assume national responsibilities. Lord Methuen, in March, urged a national army and regular military training. A South African defense bill, based on the principle that every citizen is liable to military service in time of need, and to regular military training, was under consideration at the close of the year. In the early part of the year public opinion was greatly disturbed by a series of assaults upon white women by the natives. Several cases occurred in the Witwatersrand alone, and some of them in broad daylight. A petition was presented by the women of South Africa asking for severe sentences for the perpetrators of these outrages. The Duke of Connaught returned to London in January from his tour of South Africa, and at the end of that month received an address from the city corporation at the Guildhall. In the course of his reply, after describing the hospitalities received during his visit, he warned his hearers against thinking that the formation of the union meant the beginning of the millennium. He referred to the danger of fierce political controversies and political mistakes, but declared his conviction that the South Africans would never abuse their system of free government, and would successfully solve the serious problems that confront them. The committee on closer settlement, appointed by the Senate, issued a report advocating the raising of a loan and the expenditure of £500,000 a year for land suitable for settlement, and for advances to settlers.

SOUTH AFRICA, IRRIGATION IN. See IRRIGATION.

SOUTH AUSTRALIA. A state of the Commonwealth of Australia. The capital is Adelaide, with 192,294 inhabitants, including suburbs, according to preliminary returns of the census of April 3, 1911. The area, including the Northern Territory, is stated at 903,690 square miles:—South Australia proper, 380,070 square miles; Northern Territory, 523,620 square miles. The final returns of the 1911 census placed the population of South Australia at 408,559, showing an increase of 14.01 per cent. since 1901; Northern Territory,

3310, showing a decrease of 31.20 per cent. The returns are exclusive of aborigines. The executive authority is vested in a governor, who is appointed by the British crown and is assisted by a responsible ministry. The legislative power devolves upon a parliament of two elective houses, the Legislative Council and the House of Assembly. Governor (1911), Admiral Sir Day Hort Bosanquet; premier (1911, since June 2, 1910), John Verran. See AUSTRALIA.

HISTORY. The Northern Territory, comprising the hinterland of South Australia, which extends all the way across the continent, was taken over by the federal government in 1911. The South Australian government decided in February upon an extensive irrigation scheme by means of the Murray River, in the region around Lake Barmera, the area covered to be much larger than that involved in any other irrigation scheme in Australia. It was announced by the treasurer in February that 3,000,000 acres of agricultural land would be thrown open by the government, which was also taking measures to welcome immigrants, and to make advances to settlers with a limited amount of capital. Pursuant to this policy the government decided to revive the old immigration act, which assisted immigrants under certain conditions; and a new homestead act was placed on the statute book providing for the appropriation of a sum not to exceed £100,000 a year for advances to settlers for the following purposes: The building or enlargement of a dwelling; the purchase of a dwelling house, and the payment of a mortgage. This was not to apply to anyone with an income of more than £300, or an income of which four-fifths was not the product of his personal exertion.

SOUTH CAROLINA. POPULATION. The Thirteenth Census showed a population in 1910 of 1,515,400, compared with 1,340,316 in 1900, an increase of 13.1 per cent. in the decade. The principal cities with their populations in 1910 and 1900 are given below (the figures in parentheses are for 1900); Charleston, 58,733 (55,807); Columbia, 26,319 (21,108); Spartanburg, 17,517 (11,395); Greenville, 15,741 (11,860).

AGRICULTURE. The Thirteenth Census included statistics of agriculture. These are of date of April 15, 1910. On that date the farms in the State numbered 176,434, compared with 155,355 in 1900. The land in farms was 13,512,028 acres, compared with 13,585,014. The improved land in farms was 6,097,999 acres, compared with 5,775,741 in 1900. The average number of acres per farm was 76.6, compared with 90 in 1900. The value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, in 1910 was \$392,128,314, compared with \$153,591,159 in 1900. The average value of all property per farm was \$2223, compared with \$989 in 1900. The average value of land per acre was \$19.89, compared with \$7.14 in 1900. Of the farms in the State, 65,213 were operated by owners and managers, and 111,221 by tenants. Of the farms operated by their owners, those free from mortgage numbered 47,535; under mortgage, 15,020. The native white farmers numbered, 79,424; foreign-born white, 212; negro and other non-white, 96,798. Of the non-white farmers, all but 26 are negroes. There were 25 Indians and 1 Chinese. The various kinds of domestic animals, poultry, and bees

were valued at \$45,131,380 in 1910 compared with \$20,199,859 in 1900. The cattle numbered 389,882, valued at \$7,088,259; horses and colts, 79,847, valued at \$10,147,178; mules, 155,471, valued at \$23,830,361; swine, 665,211, valued at \$2,552,344; sheep, 37,559, valued at \$81,302. The poultry of all kinds numbered 2,946,414, valued at \$1,206,615. The acreage, production, and value of the principal crops in 1910 and 1911 will be found in the following table:

	Acreage	Prod., bu.	Value
Corn1911	1,790,000	32,578,000	\$29,646,000
1910	1,707,000	31,580,000	25,896,000
Wheat1911	83,000	946,000	1,164,000
1910	77,000	847,000	1,067,000
Oats1911	345,000	7,038,000	5,067,000
1910	336,000	7,056,000	4,586,000
Rye1911	3,000	30,000	44,000
1910	3,000	30,000	44,000
Rice1911	10,000	117,000	88,000
1910	17,000	357,000	268,000
Potatoes ..1911	10,000	700,000	854,000
1910	10,000	900,000	945,000
Hay1911	64,000	a 69,000	1,173,000
1910	67,000	84,000	1,344,000
Tobacco ..1911	13,600	b11,016,000	1,388,016
1910	25,000	15,750,000	1,354,500
Cotton ...1911	c 1,480,000

a Tons. b Pounds. c Bales.

There were produced in the State in 1910, 1853 fine ounces of gold, valued at \$38,324, an increase over the value of the product of 1909 of \$27,271. A small amount of silver was also produced.

EDUCATION. During the school year 1910-11 the public schools of South Carolina enrolled 354,270 pupils; of these, 180,830 were whites, and 193,440 were negroes. The average attendance for the State was 235,028; 107,552 whites, tracts, of which 927 have voted tax levies for school purposes amounted to \$2,517,091.09, and the total expenditures amounted to \$2,168,513.41. The State is divided into 1901 school districts, of which 927 have voted tax levies for educational purposes. During the year 223 districts either voted original levies or increased existing levies.

South Carolina maintains the University of South Carolina, at Columbia, Clemson Agricultural College, at Clemson, Winthrop Normal and Industrial College, at Rock Hill, the Citadel, the Military College of South Carolina, at Charleston, the State Normal, Industrial, Agricultural, and Mechanical College, at Orangeburg, and special schools for the deaf, the blind, and for the reformation of boys.

FINANCE. The report of the treasurer for the fiscal year 1911 showed a balance on December 31, 1910, of \$648,730. The total receipts during the year were \$3,208,790, and the total expenditures, \$3,132,164, leaving a cash balance December 31, 1911, of \$725,356. The public debt of the State at the end of the fiscal year amounted to \$6,528,485.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the deaf, dumb, and blind institutions, State Hospital for the Insane, South Carolina Industrial School, and the State Prison.

POLITICS AND GOVERNMENT

The legislature met in annual session in January, 1911, and the most important measures enacted are noted in the paragraph *Legislation*, below.

The most interesting political events of the

year related to the conflict between Governor Blease and the State Supreme Court over the appointment of special judges. The governor declared he would not commission as judges those who were not his friends, and presented an "eligible list." The Supreme Court held that in refusing commissions to its nominees, the governor violated the constitution, and the chief justice characterized his course as "lawless." In a speech made at Spartanburg on July 4, Governor Blease said that impeachment proceedings had been threatened against him, and that if he were impeached and removed from office he would be a candidate for the United States Senate. Chief Justice Ira B. Jones, of the Supreme Court of the State, resigned from that office to become a candidate for governor against Governor Blease in 1912. The governor withheld all papers from the pardon board and granted more than 325 pardons and paroles. He vetoed more acts than had been vetoed in the previous 20 years. Most of them were passed over his veto. Blease declared null commissions of all notaries public, held "at pleasure of governor" for alleged purposes of ousting four or five negroes. Over 3000 were affected and most of them got new commissions.

There were no elections for State officers in 1911, but an election for mayor occurred in Charleston on November 7. The election resulted in the success of the candidate who, for the first time in the history of the State, was not a member of the conservative or aristocratic segment of society. The successful candidate was John P. Grace, who was chosen over T. T. Hyde by a plurality of 185 votes. The election was, in a measure, a contest of labor against capital, and the successful candidate was identified with the labor element.

OTHER EVENTS. On October 28 a storm and high tides caused damage to property in Charleston and along the coast of over \$1,500,000. The lower section of the city was entirely inundated for over eighteen hours. The rice industry received a severe blow, the losses resulting in abandonment of many plantations. Managers of the National Corn Exhibition decided in July to hold the 1913 exposition in Columbia, S. C., the first time in the South. Columbia provides a building and guarantees \$40,000 expenses.

LEGISLATION. Important measures passed at the legislative session of 1911 included the following: The child labor law was amended by making more strict the statute prohibiting the employment of children under 12 years of age, and prohibiting the employment of children under the age of 16 between the hours of 8 P. M. and 6 A. M. A measure was passed providing a mode of procedure against corporations charged with a violation of the criminal laws of the State. The law for the protection of game fish was amended. Measures were enacted requiring marriage licenses, and provision was made for the regulation of their issuance. The hours of labor of women employed in mercantile establishments is limited to 60 hours a week, not to exceed 12 hours in any one day, and to work not later than 10 P. M.

STATE OFFICERS. Governor, Coleman L. Blease; Lieutenant-Governor, C. A. Smith; Secretary of State, R. M. McCown; Attorney-General, J. F. Lyon; Treasurer, R. H. Jennings; Comptroller-General, A. W. Jones; Superintendent of Education, J. E. Swearingen; Adjutant-

General, W. W. Moore; Commissioner of Agriculture, E. J. Watson; Commissioner of Insurance, F. H. McMaster—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Ira B. Jones; Justices, C. A. Woods, Eugene B. Gary, D. E. Hydrick; Clerk, U. R. Brooks—all Democrats.

STATE LEGISLATURE, 1911. Democrats, Senate, 43; House, 124; joint ballot, 167.

The representatives in Congress will be found in the article UNITED STATES, *Congress*.

SOUTH DAKOTA. POPULATION. The Thirteenth Census showed a population of 583,888, compared with 401,570 in 1900, an increase of 45.4 per cent. in the decade. The principal cities, with their populations in 1910 and 1900 are given below (the figures in parentheses are for 1900): Sioux Falls, 14,094 (10,286); Aberdeen, 10,753 (4087); Lead, 8392 (6210); Watertown, 7010 (3352).

AGRICULTURE. The acreage, production, and value of the chief crops for 1910 and 1911 are given in the following table:

		Acreage	Prod., bu.	Value
Corn	1911	2,310,000	50,820,000	\$26,935,000
	1910	2,100,000	52,500,000	21,000,000
Wheat	1911	3,700,000	14,800,000	13,468,000
	1910	3,650,000	46,720,000	41,581,000
Oats	1911	1,540,000	11,396,000	4,900,000
	1910	1,550,000	35,650,000	10,695,000
Rye	1911	13,000	130,000	99,000
	1910	13,000	221,000	135,000
Potatoes ..	1911	56,000	4,032,000	2,822,000
	1910	55,000	2,420,000	2,057,000
Hay	1911	459,000	a 252,000	2,142,000
	1910	510,000	408,000	2,897,000

a Tons.

MINERAL PRODUCTION. The production of gold in the State is considerable. It comes, altogether, however, from several mines in the Black Hills. The gold production in 1910 was 260,267 fine ounces, valued at \$5,380,200. The output of silver was 120,600 fine ounces, valued at \$65,100. The gold produced in 1911, according to the preliminary figures of the director of the mint, was 359,444 fine ounces, valued at \$7,430,367, a marked increase over the production of 1910. The bulk of the gold is produced by the Homestake mine, at Lead, and the installation of additional facilities greatly increased the production at this mine in 1911. The silver produced in 1911 was 206,188 fine ounces, valued at \$113,403.

MANUFACTURES. The Thirteenth Census, taken in 1910, included statistics of manufactures in the State. These are for the calendar year 1909. The results of the census will be found summarized in the table below:

	Number or amount	
	1909	1904
Number of establishments....	1,020	686
Persons engaged in manufactures	5,226	3,582
Proprietors and firm members	942	649
Salaried employees	682	441
Wage earners (average number).....	3,602	2,492
Primary horsepower	17,666	11,154
Capital	\$13,018,000	\$7,585,000
Expenses	15,787,000	11,246,000
Services	2,914,000	1,716,000
Salaries	616,000	284,000
Wages	2,298,000	1,422,000
Materials	11,476,000	8,697,000
Miscellaneous	1,397,000	833,000
Value of products.....	17,870,000	13,085,000
Value added by manufacture (value of products less cost of materials).....	6,394,000	4,388,000

As will be seen from this table, the number of manufacturing establishments showed a marked increase in the five-year period, 1904 to 1909. The capitalization in that period nearly doubled. The greatest number of manufacturing establishments, 825, are those connected with printing and publishing. The largest amount invested, however, was in establishments connected with flour-mill and grist-mill products. While these establishments numbered but 285, the value of the product was \$6,208,000. Manufactories of butter, cheese, and condensed milk, 139 establishments, produced products valued at \$2,686,000; printing and publishing establishments, \$1,076,000; bread, and other bakery products, \$1,161,000; lumber and timber products, 451 establishments, \$945,000. The total number of persons engaged in manufactures in the State in 1909 was 5226, of whom 4588 were males, 638 females. The largest number of persons engaged in any one industry were those employed in the printing and publishing establishments. The majority of the wage earners employed in the manufacturing industries of the State are employed 60 hours or over a week.

The wage earners 16 years of age or over numbered 3602; those under 16, 46, or a total of 3648.

EDUCATION. The chief efforts in educational lines in the State were directed in 1911 toward securing State aid for such rural districts as are unable to maintain an efficient school, for normal training and high schools, and for such districts as may wish to consolidate for the purpose of forming a graded school. Considerable attention was given to the standardization of colleges and normal schools. There were in the State on June 30, 1910, 118,199 persons of school age. The average daily attendance was 49,433. The total expenditure for schools in 1910 was \$2,299,575.

FINANCE. The report of the treasurer for the fiscal year ending June 30, 1911, showed cash on hand July 1, 1910, \$602,569. The receipts for the year amounted to \$3,760,213, and the disbursements to \$4,001,626, leaving cash on hand June 30, 1911, of \$421,156.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the School for the Deaf, Northern Hospital for the Insane, Deaf and Dumb Asylum, School for the Blind, and the State Penitentiary.

POLITICS AND GOVERNMENT

The legislature met in 1911, and the most important measures enacted are noted in the paragraph *Legislation*, below. There were no elections for State officers during the year.

In the week of June 11-16 there was celebrated at Yankton the jubilee anniversary of Dakota Territory. Many pioneers of the State were present, and the chief guest of honor was Dr. William Jayne, of Springfield, Ill., who was appointed in 1861 first governor of the newly created territory by President Lincoln. In conjunction with this celebration was observed the twenty-ninth annual commencement of Yankton College, the oldest college in the State. A striking pageant, showing the history of the Territory and the State, was given on the afternoon of June 16.

On October 21 the distribution of the lands of the Sioux Indian Reservation was begun at Gregory. The reservation contained about 4000

homesteads, and there were nearly 50,000 applicants. The distribution was carried on by the drawing of lots, and the winner of the first choice was Mrs. Mary J. Kendall of Rapid City, S. D.

LEGISLATION. Important measures enacted at the legislative session of 1911 include the following: It is provided that the proposed constitutional amendments and laws or measures submitted to electors under the referendum or initiative shall be brought to the attention of the electors by the county auditor, who shall send to them through the mail pamphlet copies of such amendments, laws, and measures, in lieu of by publication of the same in newspapers. It also provides that such amendments, laws, and measures shall not be printed in full upon the official ballots at the election, but that such ballots shall merely show their titles. Provision is made for an indeterminate sentence upon certain classes of persons convicted of crime. This term shall not be less than the minimum, nor longer than the maximum term provided by law for the crime for which the prisoner was convicted, and the length of the sentence is to be determined by the warden and Board of Charities and Corrections upon facts and conclusions established by a scientific study and observation of the habits, disposition, character, conduct, and general tendencies of the convict. The anti-treat liquor law enacted in 1909 was repealed. An employers' liability law was enacted to affect common carriers by railroad while engaged in interstate commerce. This provides that contributory negligence by the employee shall not bar recovery, but that damages shall be diminished by the jury in proportion to the amount of negligence attributed to the employee.

STATE OFFICERS. Governor, R. S. Vessey; Lieutenant-Governor, Frank M. Byrne; Secretary of State, S. C. Polley; Treasurer, George G. Johnson; Auditor, H. B. Anderson; Attorney-General, Royal C. Johnson; Superintendent of Education, C. G. Lawrence; Commissioner of Lands, F. F. Brinker; Commissioner of Insurance, O. S. Basford—all Republicans.

JUDICIARY Supreme Court: Presiding Judge, Ellison G. Smith; Justices, Dick Haney, Charles S. Whiting, J. H. McCoy, and Dighton Corson; Clerk, Frank Crane—all Republicans.

STATE LEGISLATURE, 1911. Republicans, Senate 34, House 99, joint ballot 133; Democrats, Senate 11, House 5, joint ballot 16. Republican majority, Senate 23, House 94, joint ballot 117.

The representatives in Congress will be found in the article UNITED STATES, *Congress*.

SOUTHER, JOHN. An American engineer and inventor, died September 12, 1911. He was born in South Boston, Mass., in 1816. He served an apprenticeship in a foundry in South Boston, and when but 17 years of age made a pattern for the iron fence around the Boston Commons, a part of which is still in use. In 1849 he sent around Cape Horn the first locomotive and steam shovel for the railroad from Sacramento to Fulton. During the Civil War the United States government had exclusive use of his work and the machinery for sixteen war vessels was built at his plant. He also constructed machinery for removing Ft. Hill in Boston and that for the filling in of Back Bay. His machinery was used also for the Suez Canal and the French Panama Canal. In 1851 he instituted a 10-hour schedule for his employees.

He was the first manufacturer in the United States to do this. For more than twenty-five years he manufactured all the sugar machinery that was used in Cuba. He invented the steam shovel, dredger, and other devices, and built the first locomotive to take a train across the continent.

SOUTHERN NEW ENGLAND RAILWAY. See RHODE ISLAND.

SOUTHERN NIGERIA. The old protectorate of Southern Nigeria united with Lagos in 1906 to form a colony and protectorate (British). The combined area is 77,260 sq. miles, and the estimated population 6,000,000. Lagos, with 57,000 inhabitants, is the capital and chief port. Much has been accomplished in the endeavor to open up the interior to British trade, and a new rubber industry and cacao and cotton raising are being developed. The imports in 1910 were valued at £5,122,370; exports, £5,258,452 (palm oil, palm kernels, mahogany, gum, ivory, and rubber). A railway runs from Lagos to Jebba (306 miles) on the Niger, thence to Zungeru (429 from Lagos), and Minna (467), where it meets the Northern Nigeria Railway. The revenue and expenditure for 1910 amounted to £1,933,235, and £1,592,281 respectively. Sir Walter Egerton was governor and commander-in-chief in 1911.

The evils resulting from the sale of liquor to the Indians had long drawn public attention to Southern Nigeria. The United Committee for the Prevention of the Demoralization of the Native Races by the Liquor Trade brought the matter to the attention of the secretary of state for the colonies on July 11, urging the government to take measures for the restriction or prohibition of the importation. The secretary replied that the government hoped for an early meeting of the Brussels Conference, which would settle the question.

SOWDON, ARTHUR JOHN CLARK. An American merchant and public official, died June 2, 1911. He was born in Boston in 1835 and graduated from Harvard College in 1857. From 1863 to 1872 he was engaged in the real estate and mortgage business in Boston. In the latter year he retired from business. In 1874 he was a member of the commission of fifteen chosen to resist the inflation of currency and secure a fixed standard of value. In 1879-80 he was a member of the Massachusetts House of Representatives. He was active in political matters for many years. Although a Republican, he advocated the election of Grover Cleveland and in the last years of his life acted with the Democratic party in national matters. He was conspicuous in the affairs of the Protestant Episcopal Church and was a delegate to five triennial conventions. He was president of the Church Association for thirty years. For nine years he was governor of the Society of Colonial Wars in Massachusetts, and from 1905 to the time of his death was the head of the National Society.

SPAIN. A constitutional monarchy of western Europe. The capital is Madrid.

AREA AND POPULATION. The area of continental Spain is 190,050 sq. miles; with the Balearic and Canary Islands, and the possessions on the African coast (north), 194,794. Population, 1900, 18,618,086; census of December 31, 1910, 19,588,688. Population per sq. mile, 101. In the provinces of Soria and Cuenca the number of inhabitants falls to 39 to the

sq. mile. Barcelona and Biscaya are the most densely populated, the highest figure being 435. Madrid had (census 1910), 597,573 inhabitants; Barcelona, 587,219; Valencia, 233,348; Seville, 155,366; Malaga, 136,192; Saragossa, 111,701; Bilbao, 93,536; Grenada, 77,425; Valladolid, 71,703; Cadiz, 67,174.

Marriages (1910 provisional), 139,176; births, 646,787; deaths, 456,127; emigrants, 191,761; immigrants, 99,839.

EDUCATION AND RELIGION. There are 34,954 schools, with about 2,000,000 pupils. Nominally compulsory free primary education is provided, but the percentage of illiteracy is large. Sum expended by the state on education and the fine arts in 1910, 52,351,347 pesetas.

The Roman Catholic is the national religion, other sects being allowed only a limited private observance of their creeds. By the concordat of May 6, 1851, the state is obliged to support the clergy and maintain the church buildings, etc., expending for this purpose some 41,000,000 pesetas annually. The church has, however, never adhered to the provision of this concordat forbidding the establishment of more than three religious orders; and numerous wealthy and powerful orders have become established, many of which are engaged in educational and industrial occupations. The state has made some effort to diminish the burden of maintenance and reduce the number of orders, but thus far without marked success. The total number of monks is about 12,800, in 794 houses; of nuns, 43,280, in 3007 houses.

PRODUCTION. The soil is notably rich, and the official agronomic service established in 1899 has greatly stimulated cultivation. Over 7,400,000 acres have been added to the cultivated area during the past decade. The wine output is about one-seventh of the world's supply; Spain is the first of the olive-growing countries in point of production. About 75 per cent. of the total cultivated area is under cereals. Area and yield of principal crops for two years (1911 preliminary), with yield per hectare in 1910, are given below:

	Hectares		Quintals		Qs. per ha.
	1910	1911	1910	1911	
Wheat	3,809,464	3,927,892	37,407,517	40,414,186	9.8
Rye	821,418	804,299	7,009,811	7,340,311	8.5
Barley	1,348,912	1,194,000	16,614,343	18,896,974	12.3
Oats	508,232	513,305	4,212,031	4,914,592	8.3
Corn	453,924	463,402	6,951,323	7,297,780	15.3
Rice	37,563	37,678	2,111,180	642,408	56.2
Vines*	1,292,940	1,289,000	11,283,433	14,704,000	8.7

* Yield in hectoliters (must).

Area under olives in 1910, 1,396,096 hectares, yielding 6,133,991 quintals of olives, and 1,017,143 of oil. Other important crops are esparto, flax, hemp, pulse, nuts, and fruits. Sericulture is carried on. Livestock (1909): 495,000 horses; 1,699,000 mules and asses, 2,317,000 cattle, 15,471,000 sheep, 3,285,000 goats, 2,296,000 swine.

Employed in the mines (1908) were 114,039 men, 1832 women, and 21,712 children. Total value of mining output, 202,326,794 pesetas. Output and value of principal minerals, in thousands of metric tons and thousands of pesetas (1908), are given at top of page 654.

The iron-ore industry, which is important, is reported in a critical condition, due to labor difficulties, inadequate and costly transportation facilities, and insufficiency of means of exploitation.

The cotton industry employs about 68,300 looms, with 2,614,500 spindles; the woolen, 8800, with 662,000. There are 144 paper mills and 34 glass factories. About 30,000 tons of corks are manufactured annually.

The fisheries employ about 14,000 boats and 71,500 men. The annual catch (mostly sardines, tunny-fish, and cod) is valued at about 38,000,000 pesetas.

COMMERCE. The special trade is shown for three years in pesetas:

	1908	1909	1910
Imports ..	981,625,369	956,976,672	1,000,036,564
Exports ..	896,342,677	925,930,062	970,519,355

Special trade by great classes in thousands of pesetas:

Italy	16	31	Total	1,000	970

Vessels entered (1910), 21,645, of 21,488,654 tons (11,532, of 7,976,044 Spanish); cleared, 18,341, of 20,122,319 (9057, of 7,512,463 Spanish). Coasting: 57,838 vessels, of 15,580,114 tons, entered; 62,736, of 16,100,210, cleared. Merchant marine, January 1, 1911, 577 steamers, of 744,517 tons net, and 302 sailing vessels, of 44,940.

COMMUNICATIONS. Railways in operation January 1, 1911, 14,675 kilometers; telegraph lines, 37,013 kilometers; wires, 84,766 kilometers; number of offices, 1741; post offices, 5742. Post office receipts, 31,869,537 pesetas; expenditure, 12,869,793; telegraphs, 11,000,644, and 10,694,009.

The French section of the trans-Pyrenees railway is nearly completed; but there is no immediate prospect that the Spanish section will make great headway. The project comprehends a tunnel through the mountains.

FINANCE. The monetary unit is the peseta, worth 19.3 cents. The revenue and expenditure for three years are given in pesetas:

	1908	1909	1910
Rev.	1,072,126,621	1,065,704,407	1,071,240,342
Exp.	1,025,888,290	1,100,935,981	1,028,214,361

a Inclusive of 53,799,594 pesetas for military operations at Melilla.

The budget for 1911 is detailed as follows, in thousands of pesetas:

Revenue		Expenditure	
Direct taxes...	476,271	Debt	409,398
Customs	157,600	War	188,357
Sugar	40,000	Agriculture* ..	103,341

Transport	27,200	Instruction	58,325
Stamps	87,500	Worship	41,256
Other	10,100	Tax Dept.....	38,413
Tobacco	160,000	Marine	68,479
Matches	11,000	Finance	18,581
Lottery	36,000	Justice	20,093
Explosives ...	3,700	Civil list	8,900
Other	2,200	Foreign Affairs.	6,582
Domains	22,813	Leg. body.....	2,468
Treasury	25,463	Judiciary	1,030
		Colonies	1,900
		Council	643
Total	1,132,847	Total	1,122,632

* Agriculture, Industry, Commerce, and Public Works.

The budget estimates for 1912 are: Revenue, 1,132,847,211 pesetas; expenditure, 1,131,435,447 pesetas. The total public debt stood, January 1, 1911, at 9,431,104,065 pesetas.

ARMY. The new army law of June 29, 1911, established compulsory personal military service for all Spaniards. Young men declared fit for military service and comprising the annual contingent are divided by law into two groups, the first being incorporated into the regular es-

establishment, and the second receiving partial instruction in varying amounts under specified conditions. Voluntary enlistments are authorized between the ages of 18 and 21, and re-enlistments up to 30 years of age. The duration of military service is fixed at 18 years, divided into groups as follows: 1. Enrolled for an indefinite period of time. 2. First connection with the active service; three years. 3. Second connection with the active service; five years. 4. Six years in the reserve. 5. The remainder of the 18 years in territorial service.

The Spanish army is organized on the basis of a law adopted in 1907, which provides for an effective strength of 80,000 men, but allows the minister to increase this number at certain times during the year, if at others he makes a corresponding reduction so as to compensate for the outlay required. In 1911 the effective strength was 115,432, but the minister was authorized to increase this amount if he deemed it necessary. By a royal decree of September 1, 1911, the minister of war fixed the number of young men called to the colors in 1911-12 as 64,000, in addition to 118,418 who had been accepted for the service. There are eight territorial districts, each under a captain-general, with headquarters as follows: Madrid, Seville, Valencia, Barcelona, Saragossa, Burgos, Valladolid, and Corunna.

NAVY. The effective of the navy consisted in 1911 of 1 second-class battleship of 9900 tons; 1 armored cruiser of 10,000 tons; 2 armored cruisers of 7000 tons each, one cruiser of 9240 tons, one of 6000 tons, two coast-defense vessels of 7300 tons each, 2 cruisers of about 2000 tons each, 4 torpedo-boat destroyers, 6 torpedo gunboats, 8 torpedo boats. There are three training ships, a royal yacht, and some small craft.

Building are three battleships (the *España*, laid down December 6, 1909, launched in February, 1912; the *Alfonso XIII.*, laid down February 23, 1910; and a third, October 2, 1911), each with a displacement of 15,460 tons; four gunboats (ordered), of 800 tons; three destroyers of 370; and 24 torpedo boats, for coastal service, of 180 tons, with 26 knots speed. Personnel, 16,700 of all ranks, and 9000 marines. The appropriation for the ministry of marine in 1911 (budget) was 68,479,488 pesetas.

GOVERNMENT. The executive authority is vested in a king (1911, Alfonso XIII.), acting through a responsible council of ministers. The Cortes is the legislative body, composed of a senate of 360 members and a congress of deputies (404). The ministry (constituted February 9, 1910) was reconstructed as follows: Premier, José Canalejas; Interior, Ruiz Valarino; Foreign Affairs, García Prieto; Justice, Antonio Barroso; War, Lieut.-Gen., A. Luque; Marine, J. Pidal; Finance, T. Rodríguez; Instruction, A. Gimeno; Agriculture, etc., Rafael Gasset.

HISTORY

SPAIN AND THE VATICAN. The programme of the Canalejas ministry, presented in January, included the following features: The introduction of the Associations bill; a provision for compulsory military service; educational reform; restriction of immigration; the building of 20,000 miles of railway; and plans for irrigation and for colonization of the dry lands of Aragon and Catalonia. The chief issue be-

fore the Cortes during the spring session was the religious question. By the so-called Cadenas or "padlock" bill passed on December 23, 1910, the first step had been taken toward definite regulation of the status of religious associations. This forbade the entry of any new religious congregation into Spain for two years, or until the Concordat of 1851 was revised. After this the government devoted itself to securing the passage of an Associations law conceived in the spirit of the French law of 1901 and of the Canalejas and Dávila proposals of 1902 and 1904 respectively. This authorized religious associations without admitting the validity of perpetual vows and it recognized certain property rights to such authorized congregations, but it prohibited the holding of real property in excess of what was absolutely necessary for the use of the association. This and other safeguards were imposed for the purpose of guarding against the danger of mortmain. All congregations were made liable to regular taxation. Foreigners were forbidden to form religious associations until they had become naturalized. The Canalejas government resumed negotiations with the Vatican, which had been interrupted by the recall of Señor de Ojeda, and conferences took place in February. On March 2 the government received a note from the Vatican reviewing the situation and setting forth the attitude of the Holy See. It pronounced the question essentially ecclesiastical and determinable by the provisions of the Concordat, which, it declared, was the law of the Spanish state and which provided that if any difficulty arose the Pope and the King of Spain should discuss the subject with a view to a friendly settlement. The Vatican consented to reopen the negotiations on the following conditions: (1) "That the new *pourparlers* concerning the religious orders and congregations take as their starting point the provisions of the Concordat and the principles of the canon law, and that no change be made in the present legal status of the orders and congregations without previous agreement with the Holy See; (2) That, as a logical consequence, the negotiations should deal with that part of the proposed law which related to the religious congregations; (3) That while the negotiations were pending the Spanish government should refrain from taking a course that anticipated the result of the negotiations themselves." After a cabinet council, Señor Canalejas replied to this in a note affirming the supremacy of the civil power and the government's determination to present the bill to the Cortes without binding itself to enter into any preliminary agreement with the Vatican. A number of deputies interpellated the government as to its course in this matter, and there were some signs of dissension within the ministry itself, but on the whole, public excitement over the question had subsided. The Associations bill was prepared without consulting with the Vatican and was submitted to the Cortes on May 8.

THE REVIVAL OF THE FERRER AFFAIR. A ministerial crisis occurred at the beginning of April in consequence of the opposition to the government's stand on the question of revising the Ferrer trial. Republicans and Socialists had joined in an attempt to secure revision. Their spokesmen in the Cortes argued that there had been many irregularities and illegalities in the trial and condemnation of Professor

Ferrer. Their arguments turned mainly on a question of fact. They held that Professor Ferrer had not been seen in Barcelona during the rebellion except on the testimony of two witnesses, both of whom were suspects. The premier contended that there was no constitutional warrant for turning the Cortes into a final court of appeal for the revision of the Ferrer procedure and that the government had no right to pronounce upon the sentence. He defended the court and the military code and declared the discussion futile. The debate, however, brought out divergent views among the ministers and the supporters of the government. The Conservatives blamed the premier for not defending the army vigorously enough, and the Liberals, on the other hand, blamed him for not asserting with greater energy the supremacy of the civil power. Finding his own cabinet hopelessly divided on the subject, Señor Canalejas resigned on April 1, and was immediately charged with the formation of a new ministry. The debate on the Ferrer affair was resumed, but the Opposition, finding that the government still stood firmly against revision, turned their efforts toward securing the reform of the military code which the government had held out as a possibility and which was believed to form a part of its intended legislative programme. The attempt of the Republicans, however, to force the hands of the government in the matter was voted down by 179 against 23 (April 8).

THE MOROCCAN POLICY. For an account of the Spanish expedition to Alcazar and the military situation at Melilla, see MOROCCO, paragraphs on *History*. There had long been a sharp division of public opinion on the subject of the Moroccan question, one element regarding with envy and impatience the part played by France in that country, which they regarded as the natural field for Spanish conquest and expansion, and another element firmly opposing every form of military adventure as diverting the national resources from the more important tasks of democratic progress and social improvement. In response to a question raised as to the government's policy after the expedition to Fez, Señor Canalejas declared that the government had replied to France that Spain would do honor to her obligations; that it was to be feared that the serious affair at Fez would affect other parts of the empire, and that, therefore, it was the duty of Spain to take precautions against any disturbances in the vicinity of the Spanish strongholds. He asked the support of the country for the measures that the government might find it necessary to take to fulfill its obligations and declared that its course was by no means in the nature of a military adventure or in excess of the actual obligations of the country. He declared that the national honor was involved. Vague as these remarks were they had the effect of rallying the various factions to the support of the ministry. Only the Socialist deputy, Iglesias, expressed unyielding opposition. Here and there a voice was raised throughout the country against any intervention on the part of Spain in Morocco, but the main currents of public opinion seemed to favor vigorous action. Later, however, Socialists and Republicans entered into an alliance against the government's Moroccan programme and at a meeting at Barcelona in July took the government to task and declared themselves opposed to all military

adventures. Anti-militarism was preached by the visiting delegates of the French General Confederation of Labor at Madrid, and the Spanish Socialists echoed their sentiments. Another Republican and Socialist meeting was held at Santander in August under the auspices of the Social Republican Union. Some 7000 persons were present and the monarchy was violently attacked. Agitation against the government broke out in many parts of the country, and at Barcelona there was talk of a general strike. The Liberals and Conservatives, however, defended the course of the government, both in sending the gunboat to Larache and in sending the minister of war (General Luque) to the Rif country. Much alarm was caused by a sudden mutiny in the navy as showing that the revolutionary spirit had penetrated to the service. Thirty marines on board the *Numancia* attempted to seize the vessel with a view to appearing suddenly before Valencia or Barcelona and stirring up a revolution for a republic. They seemed to have been influenced by the example of the Brazilian mutineers and of the Portuguese navy. They were soon overpowered, however; their ringleader was executed and six of his comrades were sentenced to forced labor.

STRIKES AND RIOT. Toward the end of August a strike of dockers occurred at Bilbao and was followed by strikes of the men on the street railways, of miners, and of house painters. The houses of business were closed and there were conflicts with the troops. Attempts at conciliation failed owing to the refusal of the employers to make concessions in spite of the premier's request that they should do so. Plans were now made for a general strike and it soon spread to Santander, Huelva, the Asturias, Gijon, Oviedo, and other cities. It assumed revolutionary proportions and led to frequent conflicts with the troops, resulting in bloodshed. The government took prompt measures, declaring the movement revolutionary and the outcome of anarchistic plots. Martial law was proclaimed at Bilbao and the city was kept under strict military repression. Nevertheless the delegates of the strikers voted a general strike by a great majority. The railways and street car lines were stopped and Bilbao became virtually a closed port. Factories, shops, and mines stopped work. A further attempt at conciliation was made, but the employers again refused to yield. Similar conditions prevailed throughout Catalonia and there was danger that the movement would spread throughout the entire country. In Bilbao and Santander there was suffering from lack of provisions, the strikers having damaged the railways and prevented the carrying of supplies. A general strike was declared in Saragossa, San Sebastián, Valencia, Seville, and Corunna. In two of the towns a revolutionary government, modeled on the Paris commune, was declared. On September 19 the government issued a decree suspending the constitutional guarantees throughout Spain. The situation immediately improved, and on September 21 the press announced that work had been resumed at Bilbao, peace restored at Valencia, and the strike at Barcelona checked. On September 22 the premier said that the strike everywhere had ended. Many arrests were made at Bilbao and the prisons were crowded. Two Republican journals were suspended, but

the others remained under censorship. The constitutional guarantees were not restored until October 22.

Premier Canalejas attributed the movement to plots of the Radicals, Socialists, and anarchists, and pointed to the existence of a committee of Spanish and foreign anarchists and trade unions at Barcelona, with a programme involving the use of dynamite and the intimidation of the country. Their agents, it was said, had been dispatched throughout the entire country to incite rioters, and it was charged that at many points, had raised the cry of "Long live the Republic." The majority of this committee were arrested, the others fled. But the Radical leader, Lerroux (?) denied that the strikes had any political character or that the Radicals had any concern in them. He said it was too soon for a Republican attempt since the Republican forces were too much divided and lacked a chief, although he believed Spain was really Republican, and declared that under favorable conditions his party would aid in a movement to change the form of government. The Socialist leader Iglesias also protested that his party had no concern in the strikes. The government at the same time that it issued its decree suspending the constitutional guarantees announced definitely that it had evidence of this political conspiracy in Barcelona and Valencia, and that it knew all the details, including the sources of the funds that supported the movement and the persons to whom they were remitted.

ELECTIONS. The provincial elections on March 12 showed the anti-monarchical parties to be increasing in numbers in spite of the divisions in their ranks. Forty Republicans and four Socialists were returned, but compared with the strength of the great monarchist groups, the Liberals with 253 and the Conservatives with 140, they were still in a hopeless minority. The municipal elections, however, held on November 12, had opposite results. Surprise was caused shortly before the elections (October 23) by the declaration of the Radical leader, Lerroux, that the government's course in Morocco had been necessary for the fulfillment of its obligations and for the honor of Spain. He blamed the Conservative Maura government for the state of affairs and declared that the present government could not have acted differently. He declared that his party repudiated the Republicans and the Socialists when they attacked the bourgeoisie and the army. He declared himself a Republican and he designated Barcelona as the future capital of the Republic. He said he would unalterably oppose the Conservatives and the Maura government if they returned to power. In contrast to the divisions among the anti-constitutional parties, there was a monarchist bloc comprising Liberals, Conservatives, Ultramontanes, and Carlists. As to the Socialist Republican Union, although it was bitter in its opposition, its power was diminished as a result of the strikes, for a good many of its members were behind bars for the part they had taken in them. On the whole, the elections showed a great gain for the monarchists. Out of 49 large places only 3 chose Republican majorities. The Republicans lost three seats at Madrid, giving the monarchists the majority of 28 to 22. They were defeated also at Valencia. In other important cities also the monarchists were successful.

THE CULLERA MURDER. In September, during the general strike, rioters in Cullera in the province of Valencia murdered a magistrate and wounded several court officers. Seven of the rioters were arrested and first tried by a military court, which sentenced six of them to death. After this the case went to the Supreme Council of War and Marine, which condemned all seven. The Radicals bestirred themselves on behalf of the condemned men and succeeded in arousing popular sympathy for them. Many petitions favoring reprieve were presented and the prevailing public opinion was so clearly in favor of mercy that the premier urged the king to reprieve six of the prisoners, but to let the sentence of death stand against one of them named Chuqueta. There was a strong popular feeling against the execution of Chuqueta and the Radicals of Barcelona became especially pressing. The movement gathered force and towards the close of the year there were signs that the government, recalling the lesson of the Ferrer affair, was weakening.

SPAULDING, ALBERT. See MUSIC.

SPENCER, EDGAR A. An American jurist, died May 5, 1911. He was born at Cherry Valley, N. Y., in 1847, and was educated at the Cherry Valley Academy and Cooperstown Seminary. He studied law and was admitted to the bar in 1875. He practiced at Gloversville and was city attorney from 1879 to 1882. He was a member of the New York constitutional convention in 1895. In 1901 he was elected a Supreme Court justice for the term ending 1915.

SPERANZA, CARLO LEONARDO. An Italian educator, died June 17, 1911. He was born at Padua, Italy, in 1842, and in his early life spent some time in the army. He studied at the University of Padua and obtained his licentiate in 1861. Five years later he received the degree of doctor of jurisprudence. About 1870 he removed to America and for three years taught Italian in Yale University. After this he devoted himself to private teaching for several years and then became professor of Italian at Columbia University. In 1891 he was made instructor in Italian and Spanish at that institution and in 1893 instructor in Romance languages and literature. In 1902 he was made full professor of Italian. He specialized in the study of Dante and was an occasional contributor to magazines. In 1897 he was made a chevalier of the Crown of Italy.

SPERRY, CHARLES STILLMAN. A rear-admiral, retired, of the United States navy, died February 1, 1911. He was born at Brooklyn in 1847. During his boyhood his family removed to Waterbury, Conn., and he received his early education in the public schools of that town. He graduated from the United States Naval Academy in 1866. After rising through the various grades he was made commander in 1894. In 1891 he took part in the cruise of the White Squadron which made a visit to European waters. During the Spanish-American War he was, greatly to his regret, detailed as ordnance officer in the Brooklyn Naval Yard. Immediately after the war, however, he was placed in command of the cruiser *Yorktown* at Manila. When the revolt of Aguinaldo broke out in 1899 he was ordered to take this vessel down the east coast of Luzon and cut off Aguinaldo's retreat with a landing party in the rear of his army. He executed this commission with great

efficiency. In the course of the land manoeuvres half of the *Yorktown's* men were cut off and captured by the insurgents. The remainder pursued the insurgents the full length of the island of Luzon before they recaptured the American prisoners. Admiral Sperry was afterwards placed in command of the *New Orleans* in Asiatic waters. In 1903 he was appointed president of the Naval War College at Newport. In 1906 he was detached for special duty in the State Department and was one of the American representatives at the second Hague conference, 1907. He did much in formulating the Declaration of London (1909), setting forth the principles of maritime law to be applied by the prize court at The Hague. In the cruise of the sixteen battleships around the world in 1908, Admiral Sperry commanded the second squadron of the fleet until the time of his arrival in San Francisco, when on the retirement of Admiral Evans he was placed in command of the entire fleet. He was severely criticised during the visit of the fleet at Manila for refusing to allow the men of the fleet shore leave, thus throwing into confusion the elaborate scheme for their welcoming. He said that he had acted thus because of the prevalence of cholera in Manila. In September, 1909, he reached the age limit and was retired. He was offered the presidency of the Naval War College but declined, and after a brief period of subordinate duty at the college he gave up naval affairs altogether.

SPIELHAGEN, FRIEDRICH. A German novelist, died February 24, 1911. He was born at Madgeburg in 1829 and was educated at the universities of Berlin, Bonn, and Greifswald. He began his active life as a teacher at Leipzig and in 1859 became editor of the *Zeitung für Norddeutschland* in Hanover. Thence he moved in 1862 to Berlin and edited from 1878 to 1884 Westermann's *Illustrierte Monatshefte*. His first novel, published in 1860, was entitled *Problematische Naturen*. For a time he dealt with social problems arising from the conflict between the nobility and the intelligence of the nation. He treated the subject with an aggressive optimism which won a popularity that he afterwards maintained by sensational novels of a lower type. He translated into German selections from several well-known American writers, among them George William Curtis and Emerson. His collected novels appeared in twenty-two volumes in 1895.

SQUIRES, HERBERT GOLDSMITH. An American diplomat, died October 20, 1911. He was born in Madoc, Canada, in 1859, and was educated at the Minnesota Military Academy and the United States Artillery School. He was appointed second lieutenant in the First United States Infantry in 1877 and in 1880 was transferred to the Seventh Cavalry. From 1885 to 1890 he served as military instructor in St.

John's College and afterwards returned to the regular service. He resigned in 1891. In 1894 he was appointed second secretary to the United States embassy at Berlin. From this office he retired in 1897 and in the following year was appointed secretary of legation at Peking. During the siege of that city 1900-1901 he served as chief of staff to Sir Claude MacDonald. For this he received the thanks of the British government. He was appointed United States minister to Cuba in 1902, serving until 1905, when he resigned. In 1906 he was appointed minister to Panama, remaining until 1910, when he also resigned this post.

STANDARD OIL COMPANY. The most important decision of the United States Supreme Court under the Sherman anti-trust law of 1890 was handed down May 15, 1911. In November, 1909, the Standard Oil Company of New Jersey, seven individual defendants and thirty-six subsidiary companies, had been declared a combination in restraint of trade and therefore illegal under the Sherman act. This decision resulted from a suit which had been begun in November, 1906, in the United States Circuit Court in St. Louis. This suit for the dissolution of the Standard Oil combination followed an elaborate and painstaking investigation of the entire history of this company by the bureau of corporations. An appeal was taken from the above decision to the Supreme Court in December, 1909, the case being argued in March, 1910. The death of Justice Brewer in that month, and subsequent changes in the membership of the court, made it advisable to reargue the case. This was done in January, 1911. In addition to oral arguments the court record included 23 volumes of printed matter, aggregating about 12,000 pages. The decision of May 15, however, covered only 28 pages, to which the separate opinion of Justice Harlan added 13 pages.

The main contention of the attorneys for the defense was that the Standard Oil Company was not a combination, but the result of the natural evolution of an expanding industry. They contended that the subsidiary companies were not at one time rival companies, but were organized by the Standard Oil Company to take care of one or another branch of its continually expanding operations. They also argued that since the Standard Oil Company was not a public service corporation but a private undertaking, it could use all the shifts and devices of traders.

The government, on the other hand, endeavored to show from the detailed history of the company that it had manifested an obvious intent to restrain competition and to secure a monopoly of the petroleum business. Evidences of this intent were found in unfair methods, price discriminations in local competition, espionage of rivals, railway rebating and other control of transportation, the formation of independent concerns, and other devices. By these unfair means, the government contended, a condition of actual monopoly in that trade was established and maintained.

The opinion of the court, in which eight members concurred, was written by Chief Justice White. He reviewed the history of the Standard Oil combination, and then set forth an interpretation of the first two sections of the anti-trust law. The first section declares "every contract or combination in the form of trust

or otherwise, or conspiracy in restraint of commerce among the several States or with foreign countries, is hereby declared to be illegal." The second section says: "Every person who shall monopolize or attempt to monopolize, or combine or conspire with any other person or persons to monopolize, any part of the trade or commerce among the several States or with foreign nations shall be deemed guilty of a misdemeanor." Chief Justice White's opinion found "that the sole subject with which the first section deals is restriction of trade, as therein contemplated, and that the attempt to monopolize and monopolization is the subject with which the second section is concerned." He then declared that the terms "restraint of trade" and "monopolize" are intended to be mutually supplementary. Since applied to all kinds of contracts and combinations "it inevitably follows that the provision necessarily called for the exercise of judgment, which required that some standard should be resorted to for the purpose of determining whether the prohibitions contained in the statute had or had not in any given case been violated. Thus it follows that it was intended that the standard of reason, which had been applied to the common law, was intended to be the measure used." Having then developed the proposition that the second section was intended primarily to make the prohibition of the first section more complete and perfect, he said: "It becomes obvious that the criterion to be resorted to in any given case for the purpose of ascertaining whether violations of the section have been committed is the rule of reason guided by the established law and by the plain duty to enforce the prohibitions of the act."

The opinion then went on to support the Circuit Court in finding the Standard Oil combination guilty of violating both sections of the law. In the first place the unification of power and control over petroleum and its products, which inevitably resulted from the formation of the New Jersey corporation, "gives rise to the prima facie presumption of intent and purpose to maintain the dominance over the oil industry by new means of combination." In the second place, this presumption is made conclusive by considering, first, the conduct of the persons or corporations involved, and, secondly, by considering the proofs of the substance and manner of achievements under the agreement involved in the combination. The opinion pointed out, in reviewing the history of the combination, that "no disinterested mind can survey the period in question without being irresistibly driven to the conclusion that the very genius for commercial development and organization begot an intent and purpose to exclude others."

The Circuit Court had ordered the dissolution of the New Jersey corporation within 30 days. The Supreme Court approved the dissolution of the combination, but allowed a period of six months for the accomplishment of this end. The decree permitted the various subsidiary companies to make reasonable contracts and agreements with each other.

DISSOLUTION. The dissolution of the company became effective September 1. It should be understood that this did not involve the discontinuance of the Standard Oil Company of New Jersey; it merely dissolved the control which that company had theretofore main-

tained over the other oil companies carrying on various branches of the oil business in different parts of the country. The Standard Oil Company of New Jersey relinquished its ownership of the stocks of these other oil companies, their aggregate capitalization being \$145,000,000. These stocks were apportioned among the stockholders of the parent corporation. Thus, after the decree of the court was carried out, each stockholder in the Standard Oil Company of New Jersey had in his possession his shares of stock in that corporation and an equal proportion of the shares in each of the other companies.

It was generally doubted whether this plan would secure real competition between the various concerns. It was pointed out that about ten men owned a majority of the stock of the New Jersey company, and consequently of each of the other companies, and it was not to be expected, in view of this, that these companies would not work in harmony. This opinion was not changed by the retirement of the Rockefellers from active direction of the company, and the accession of J. D. Archbold to the presidency, for this involved no change in actual control or policy. See TRUSTS for discussion of the "rule of reason" laid down in the foregoing decision.

STANDARD TIME. At midnight, March 10, 1911, France officially adopted Greenwich time as a basis for all official reckoning throughout the republic and Algeria and in Whydah. This means a change of 9 minutes and 21 seconds from Paris time, which previously had been observed. Portugal and all the Portuguese colonies also adopted the Greenwich time, to take effect January 1, 1912, and Western European time, based on the meridian of Greenwich, was to be used in Portugal and the islands of Principe and São Thomé. Russia and Ireland were the only countries of importance outside of the universal time arrangement. See ASTRONOMY.

STANNARD, HENRIETTA ELIZA VAUGHAN (PALMER). An English novelist who wrote under the pseudonym John Strange Winter, died December 14, 1911. She was born at York, England, in 1856, and was educated at Bootham House, York. In 1874 she published her first story, which was printed in the *Yorkshire Chronicle*. This was followed by more than forty novels and novelettes before her reputation was attained by the publication of *Bootes' Baby*. At the suggestion of her publishers she adopted the pen name above-mentioned. Mrs. Stannard wrote so well of army life that she was called by Ruskin "the author to whom we owe the most finished and faithful rendering ever yet given of the character of the British soldier." Her knowledge of garrison life was derived from the fact that her father had been an artillery officer at York where she had ample opportunity to observe the ways of military men. Next to *Bootes' Baby* the best known story is perhaps *The Truth Tellers*. Among others she wrote *A Born Soldier*, *Beautiful Jim*, *In Quarters*, *The Soul of the Bishop*, *Only Human*, *Jimmy*, *The Little Vanities of Mrs. Whittaker*, and *Garrison Gossip*. She was married in 1884 to Arthur Stannard. She was the first president of the Writers' Club of London and was for two years president of the Society of Women Journalists. She was also a fellow of the Royal Society of Literature.

STATE BANKS. The report of the controller of the currency for 1911 summarizes the condition of 12,864 State banks, having an aggregate capital of \$452,954,000, and aggregate resources of \$3,747,000,000. The principal item of resources was loans and discounts of \$2,439,000,000; the resources also included \$315,550,000 of bonds and other securities, and \$313,500,000 cash and exchanges for clearing houses. The individual deposits amounted to \$2,777,000,000. The number of depositors as reported by 10,555 banks was 2,738,000 savings depositors, and 4,494,000 other depositors. The savings deposits were mainly in banks of the middle Western States; one-fourth of all being credited to the banks of Michigan. The average rate of interest paid on the savings deposits in State banks ranged from 2.91 per cent. in the New England States to 4.15 per cent. in the Western States. The Middle Western States had State banks to the number of 4119; in the Southern States there were 3861; in the Western States 3471; in the Pacific States 930; in the Eastern States 434; in the New England States 20; and in the island possessions 29. Missouri alone reported 1079 State banks; Kansas 855; Minnesota 712; Nebraska 630; and Oklahoma 631. About one-third of the capital and more than one-third of the resources of these banks were held by those of the middle Western States. Those of the Southern States ranked second in the amount of capital and third in the amount of resources, being exceeded in this last named by the banks of the Eastern States. See **BANKS** and **BANKING** for a discussion of the *Guarantee of Deposits*.

STATISTICAL ASSOCIATION, AMERICAN. The seventy-third annual meeting of this association was held at Washington, December 28-30, 1911. President Frederick L. Hoffman opened the first session, being followed by Mr. Roger W. Babson on "Forecasting Business Conditions by the Study of Statistics." He developed the possibilities of forecasting periods of prosperity and depression by means of statistical data and declared that the national government should assume the function of forecasting business movements just as it now forecasts weather conditions. Other speakers emphasized the difference between statistics and estimates and expressed doubt as to the practicability of applying estimates on such a comprehensive scale as that contemplated by Mr. Babson. Another session was devoted to the subject of immigration; nationalization of immigrants and the effect of immigration on wages and standards of living were discussed by statistical experts of the United States Immigration Commission. Other sessions were held in connection with the American Economic Association (q. v.) and the American Association for Labor Legislation (q. v.). Prof. Walter F. Wilcox of Cornell was chosen president for the year 1912.

STATUES. See **SCULPTURE**.

STEAM TURBINE. During 1911 there was put in service at the Waterside Station of the New York Edison Company a 20,000-

kilowatt vertical Curtis turbo-generator, which was the largest prime mover ever built. This installation was most successful, and similar units were being designed and built for the Waterside Station and for the new Northwest Station of the Commonwealth Edison Company of Chicago. Nor was this considered to mark the limit of capacity of the steam turbine, for turbo-generators rated at 25,000 kilowatts and even greater were thought to be possibilities of the near future. As contrasted with the vertical steam turbine used for the larger generators such as those just mentioned, there is the horizontal turbine, which has been preferred for machines under 10,000 kilowatt capacity. Nevertheless, builders of these horizontal machines express their ability to build such units up to any capacity. In addition to their use with alternate-current generators, turbines were employed with large direct-current generators where a lower speed or revolution is required by means of a successful high-power reduction gear which had been brought to a requisite degree of efficiency. Another tendency of the year was to use higher speeds with some of the larger steam turbines, some of which up to 10,000 kilowatt capacity were being provided at 1500 and 1800 revolutions per minute.

The use of large turbo-generators makes possible great economies, especially in a central station work, for both electric railway and power generation. It is possible to concentrate the steam units in a single station, and use rotary converters at sub-stations where formerly isolated engine plants were maintained. In certain plants where electricity and steam for heating both are produced, a recent development was the so-called "bleeder" type of turbine. In this system an automatic valve between the intermediate and low-pressure stages enables some steam to be diverted, or "bled" from the turbine, which can be used in the heating system or for various auxiliaries. In regard to the latter many small sized turbines, mostly of the small reentry type, were being established in sizes from one to 300 kilowatts, to operate exciters, centrifugal pumps, and other auxiliaries of the power plant. These small turbines were also being used for driving the generating units in isolated plants of limited capacity.

THE TESLA STEAM TURBINE. A new type of steam motor which promised extraordinary efficiency and economy was developed during 1911 by Nikola Tesla, the electrical engineer and inventor. It consists of a series of flat steel disks mounted on a shaft and rotating within a casing. These disks, which are made of thin plates of hardened and tempered steel, are mounted on the shaft with intervals between adjacent plates, so that the steam entering by an inlet nozzle at the top of the casing might pass along their surface to the center, where portions of the disk are cut away so that the steam may escape by a suitable outlet. With the disks at rest, the steam flows in rather a short curved path from the periphery to the central exhaust opening, but when they are in rotation the steam travels a spiral path which increases with the speed of revolution so that the particles of the fluid may complete a number of turns around the shaft before the exhaust is reached, while at

the same time there is a reduction in velocity and pressure of the steam. In other words, the action of the motor depends upon the attraction and adhesion of the steam to the surfaces of the disks, and its velocity on the resistance of the particles of the moving fluid to separation. In this way the energy of velocity of the steam is transmitted to the plates and the shaft. This is quite different from the use of the expansion force of the steam by its pressure on the piston of a steam engine, or the reaction or impact as in various forms of steam turbines. In the Tesla motor the changes in the velocity and direction of the movement of the steam are made as easy and gradual as possible, so that not only is theoretical efficiency gained, but the mechanical construction is greatly simplified. Mr. Tesla's experimental turbine developed 200 horsepower, with 125 pounds steam pressure and exhausting directly to the atmosphere, with a heat drop of only 130 British thermal units taking place within, an amount only about one-third that available in a modern steam plant where superheated steam and vacuum exhaust are available. Were this machine compounded with a low-pressure unit with three times as many disks, and connected to a condenser with 28½ to 29 inches of vacuum, some 600 horsepower could be secured. In addition to its economy, the Tesla turbine has an advantage not possessed by other motors of this class in that it is readily reversible without any loss of efficiency, a duplicate inlet nozzle being provided for this purpose.

STEEL, MANUFACTURE OF. See CHEMISTRY, INDUSTRIAL.

STEENSTRA, PETER HENRY. An American theologian, died April 26, 1911. He was born in Holland in 1833. Removing to the United States, he settled at St. Louis in early boyhood. He graduated in 1858 from Shurtleff College. The same year he entered the Baptist ministry, but changed in 1864 to that of the Protestant Episcopal church. From 1867 to 1907 he was professor of Old Testament literature and interpretation in the Episcopal Theological School at Cambridge. From 1907 to the time of his death he was professor emeritus. He was the author of *The Being of God as Unity and Trinity* (1891) and of chapters on the Earlier History of Israel and on Hebrew Literature in Vol. II. of Wright's *History of all Nations*.

STETSON, CHARLES WALTER. An American artist, died July 20, 1911. He was born at Tiverton Four Corners, R. I., in 1858. He was educated in the public schools of Providence and at once began painting. His first exhibitions were in Providence. He later exhibited pictures in Boston, Philadelphia, Chicago, and other cities of the United States. He exhibited at the Pan-American Exposition, in the New Gallery in London, and in Rome. He also executed a number of etchings, examples of which are in the Boston Museum. For many years he lived and painted in southern California. For sev-

eral years previous to his death he resided in Rome.

STILES, WILLIAM CURTISS. An American clergyman and teacher, died August 15, 1911. He was born at Stoneham, Me., in 1851 and studied at Tufts College. He graduated from Tufts Divinity School in 1876. He was ordained to the Universalist ministry in the same year, with a pastorate at Orleans, Mass. In 1880 he entered the Congregational ministry and was pastor at Brooklyn from 1880 to 1884; St. Louis, 1884 to 1886; Pittsfield, N. H., from 1887 to 1890; Jackson, Mich., from 1892 to 1896, and Stonington, Conn., from 1897 to 1901. From 1890 to 1893 he was on the editorial staff of the *Standard Dictionary* and was associate editor of the *Homiletic Review*. He was the author of the following stories: *Literary Dozen* (1893); *Matter of Business* (1898); *Excuse Me* (1898); *Double Jeopardy* (1899); *Out of Kishineff* (1903), and *The Upper Way* (1904). He was coeditor of *Modern Sermons by World Scholars* (1908). He contributed much to magazines, encyclopædias, and religious journals.

STIMSON, HENRY LEWIS. An American lawyer, appointed on May 12, 1911, secretary of war, succeeding Jacob M. Dickinson, who had resigned. He was born in New York City in 1867 and graduated from Yale College in 1888. After studying at the Harvard Law School, he was admitted to the bar in 1891. He became a member of the firm of Root & Clarke, of which Elihu Root was senior partner. On the withdrawal of Senator Root in 1897 he formed the partnership of Winthrop & Stimson, which was continued until 1901. From 1906 to 1909 he was United States attorney for the Southern District of New York. This appointment first brought him into public notice. The three years in which he held this office were notable for the number of conspicuous government prosecutions. These included the sugar trust frauds and the prosecution of several railroads for rebates given to this trust. As a result of these prosecutions over \$3,000,000 was returned to the government and nearly \$400,000 was collected in fines for rebating. It was under his administration also that E. H. Harriman was made to testify concerning his railroad operations and that Charles W. Morse was tried and convicted of misapplication of funds of the National Bank of North America. Shortly after the inauguration of President Taft, Mr. Stimson resigned. He continued the prosecution of the government fraud cases as special counsel. He was nominated by the Republicans for governor of the State in 1910. He was identified with the progressive element of the party and, although he made an active and aggressive campaign, was defeated by John A. Dix.

STOCK-RAISING AND MEAT PRODUCTION. The total number and value of livestock in the United States in 1911 was about the same as in 1910, when there was a small loss in total value over the previous year, but the preliminary statements of the Thirteenth Census show large increases since 1900, especially in horses, mules, dairy cows, and poultry. In 1900 cattle constituted 48 per cent. of the value of all livestock on farms, far in excess of any other class of animal; but in 1910 horses had taken first place. Cattle increased in value only 0.7 per cent. during the decade, whereas the value of horses increased 131.6 per cent. The increase in horses and

mules is largely in the mature class. There was also an increase in value per head.

CATTLE. The year's receipts at the livestock market in Chicago show that the year's cattle supply was the smallest, with the exception of 1909, since 1900. The calf receipts were the largest on record. The hog supply was the largest since 1908, and more sheep were marketed than ever before, both at Chicago and at all the other large markets, and the horse receipts were the largest within the last half decade. There was a grand total of 16,397,492 head of livestock of all classes received at the stock yards, which was nearly 2,000,000 greater than in 1910, and over 16,000 in excess of the arrivals for any previous year. Receipts of cattle decreased in all Western markets, except Sioux City, the Southwestern markets showing the greatest percentage of decrease.

Cattle values did not average so high as in 1910, though butcher cattle sold relatively high throughout the year, and high prices were obtained at the end of the year. For two years the United States has been importing more cattle than it has exported in a numerical sense, but aside from the number there have been large imports of cheap stock cattle from Mexico, so that the value of the export live cattle exceeded that of the imports. The export of packinghouse products reached \$150,000,000, a gain of \$21,000,000. The export of live animals was valued at \$19,000,000, a gain of \$2,000,000 over 1910. The exports of cattle, horses, mules, and sheep, dressed beef, and pork reached their highest figures in 1900 to 1904. The highest figure ever reached for swine was between 1870 to 1879; and for butter and cheese, 1880 to 1889. The exports of eggs and mutton are increasing at the present time. Beef production seems to be in a transitional stage. The free range of the West has been broken up, while in the East the dairy industry has supplanted the raising of beef. The liquidation resulting in making these changes is now about completed, and the future of the beef supply will be provided for on a different basis. At the present time it looks as if the beef industry will be in the hands of small holders, while skilled breeders will give their stock better winter care in the days of bonanza ranching. More range cattle were shipped to the Pacific coast than was ever known before. This was because of the increase in population, and higher prices were paid than were offered by Eastern buyers. More interest is taken in beef production in the Southern States, and the feeding experiments at the Alabama station in co-operation with the Department of Agriculture demonstrate that cattle can be profitably fed in Alabama in summer. The pork feeding investigations also show profitable results. In the future the South will afford a more favorable field for raising cattle, especially after the handicap of the cattle tick has been removed.

In a series of feeding experiments at the Nebraska station it has been demonstrated that a combination of corn and alfalfa is superior to the old method of fattening cattle for market, which consists of feeding heavily with grain and using little roughage. In a five-year trial of fattening cattle on blue grass pasture at the Missouri station better gains were made and a more uniform finish was obtained when corn was supplemented with other concentrated feeding stuffs than when fed alone. Several of the

experiment stations have also shown that the heavy feeding of silage can be followed with advantage in fattening cattle. In one case three pounds of gain per day was made with very little grain, and the beef produced was of excellent quality. The feeding of beet pulp, sugar-beet tops, and sugar syrup to cattle and sheep has become an important industry, when fed in connection with alfalfa and straw.

A factor in the export of meat at the close of the year was the announcement of the British war office that it would order no more beef from the Chicago packers until the criminal suit against them had terminated. During the year plans were adopted by the Texas Cattle Raisers' Association for the organization of selling agencies, with a paid-up capital of \$3,000,000, the particular object of which was to bring the producers and consumers closer together. The construction of independent packing houses or municipal abattoirs was also advocated at the Fort Worth meeting of the producers' and consumers' congress.

But with the increase in the price of feeding stuffs and the constantly increasing population it is evident that the production of meat in this country is falling off quite seriously in proportion to the population. Fewer sheep and cattle are being raised in proportion to the population than ever before.

An investigation of the cold-storage industry by the Department of Agriculture has shown that cold storage has a pronounced tendency toward a uniformity of prices in regard to butter, eggs, poultry, and fresh mutton, and a tendency away from uniformity in regard to fresh beef and fresh pork.

During the year a combination of American capitalists was formed to establish in Brazil the largest beef-producing market in the world. A syndicate has bought from the Brazilian government 1900 acres of land, on which cattle can graze throughout the year. It is the intention to export to Europe from the port of São Paulo, which will be the headquarters of the syndicate. The aim will be to produce chilled beef, as the prospect is that Great Britain and Germany would not make any great concession to Brazilian live beef even under the best possible management, as South American live beef has been barred from the European markets for ten years because of the prevalence of foot-and-mouth disease. The syndicate expects to run its own line of steamers with every facility for refrigeration, and hopes eventually to open the ports of England to live beef by introducing modern methods of production and shipment.

HORSE BREEDING. The year 1911 was a good one for the breeders of horses, especially for heavy draft horses, as the demand steadily kept ahead of the supply, and several horses weighing 1600 pounds have sold at from \$300 to \$425 per head on the Chicago market. A record-breaking price for a draft horse was obtained when the Clydesdale stallion, Baron O'Buchlyvie, was sold in England for \$47,500.

The supply of horses fit for the United States army remounts has become so limited that it has been necessary for the government to take steps for the encouragement of breeding army horses. There is a constantly growing demand for American-bred horses, and many attempts have been made to meet this in various ways. National and State aid has been given to its

coöperative breeding work at the experiment stations. Several States have passed so-called stallion laws, relating to registration and control of stallions used for public service in order to prevent fraud and to eliminate the unsound.

In accordance with arrangement with the Treasury Department, the Bureau of Animal Industry has completed the first year's inspection for the pure breeding of all animals imported for breeding purposes. During the year 3178 horses, 1770 cattle, 1620 sheep, 37 hogs, 504 dogs, and 27 cats were thus imported. The Pure-Bred Sire League, inaugurated by Dr. Alexander in Wisconsin, is growing, and a similar organization formed in Kansas through the efforts of the Kansas Agricultural College is called the Pure-Bred Sire Club.

MISCELLANEOUS. In the Southern States hog clubs have been formed among the boys as a sequence to the corn clubs, in order to interest them in the keeping of better stock and improving the methods of feeding. Nearly all of the leading record associations have taken out membership in and are coöperating with the National Society of Record Associations, formed at the beginning of the year.

The estimate of the value of poultry products in the United States in 1911 was \$750,000,000. There is, however, a great loss due to the poor handling of eggs and improper methods of dressing poultry for the market. These problems have been studied by the Department of Agriculture, and have resulted in improving the egg trade by recommending the "loss off" method for the "case count" system.

FOREIGN COUNTRIES. Argentina ranks third as a cattle-producing country, being out-ranked only by Russia and the United States, and is the leading country in beef exports. The last available figures for livestock in Argentina are the following: Cattle, 27,124,229; sheep, 67,363,952; horses, 7,537,675; mules, 465,054; asses, 285,113; goats, 3,946,750; pigs, 1,404,261.

In Canada during the year there was a decrease in the number of milch cows and sheep, but an increase in all other kinds of livestock. The livestock figures for Great Britain for the year are as follows: Horses, 1,627,393; cattle, 7,114,264; sheep, 26,494,992; pigs, 2,822,154; These figures show an increase in cattle and pigs, and a decrease in sheep. The number of cattle is the largest on record. It is estimated that in England more eggs are produced per annum, to the value of \$25,000,000, than were produced twelve or fifteen years ago, yet about \$35,000,000 worth of eggs and \$4,000,000 worth of poultry are imported. The supply coming from the different countries is in the following order: Russia, Denmark, Austria-Hungary, and France. Some are also imported from Italy, Belgium, Canada, and the Balkan States. In Ireland the value of exports of eggs and poultry has been steadily increasing for ten years, so that they are now third in importance as regards exports, being only exceeded in value by the exports of linen and cattle. This growth is largely due to the efforts of the department of agriculture.

An official inquiry was made into the high price of meat in Germany in 1910. Inquiries showed that the number of cattle, calves, and sheep was smaller in 1910 than in 1909, but greater than the averages for the preceding ten

years, as more pigs were marketed in 1910 than in any five of those years. It was concluded that the increase in price was due largely to the increase of consumption of meat per head of population. There were meat riots in Vienna in September, 1911, because of the high price of meat. The imports of fresh and frozen meat had been stopped for several years, and a cattle epidemic in the spring had reduced the domestic stock. Argentine meat was admitted during a part of the year, and the riot was caused when the socialists read that a shipload of several hundred tons which had arrived in August was forbidden by the Hungarian government to be landed.

Horse breeding is assuming enormous proportions in France and Belgium. In Belgium there were over 31,000 heavy horses exported during the last fiscal year. On the other hand, 23,000 light horses were imported, and 22,000 others imported for slaughtering. The livestock industry is growing rapidly in Siberia, especially the dairy industry. The herds of small, long-horned cattle are being replaced by Shorthorns, Jerseys, and other improved breeds. The coarse-wool black sheep are giving place to the Cotswold and Shropshires. The improved hogs are driving out the old-fashioned black hog. In the Philippine Islands the breeding of all classes of livestock has steadily increased since the American occupation, but there is a shortage due to increased demand. The number of livestock on the islands is now estimated as follows: Horses, 215,674; cattle, 242,398; carabaos, 713,121; hogs, 2,062,605; goats, 287,087; sheep, 88,760; chickens, 5,470,981; turkeys, 9201; ducks, 78,215; geese, 6202. Importations of European breeds of cattle and zebus have been made and are giving good results when crossed with native stock. But little attention has been given to the sheep industry.

Some of the principal books on livestock published during the year are the following:

M. W. Harper, *Manual of Farm Animals*, New York; F. B. Marshall, *Breeding Farm Animals*, Chicago; J. E. Halligan, *Elementary Treatise on Stock Feeds and Feeding*, London, England, and Easton, Pa.; C. Richardson, *The New Book of the Horse*, London, New York, and Toronto; C. S. Plumb, *A Partial List of Animal Husbandry Literature*, Columbus, Ohio; A. L. J. Gosset, *Shepherds of Great Britain*, London; and U. Telschow, *Grundrisse der neuzeitlichen Schafzucht*, Hanover, Germany.

STOCKS AND BONDS. See FINANCIAL REVIEW.

STODDER, LOUIS N. An American naval officer, died October 8, 1911. He was born in New York City in 1837 and was educated in the public schools of that city. He studied navigation and had some experience at sea. At the outbreak of the Civil War he volunteered for service. He was assigned to the *Monitor* at her launching as acting master and continued in that capacity until she foundered off Cape Hatteras while being towed southward for service. During the famous battle with the *Merri-mac* he was in charge of the turret of the *Monitor* and fought the turret guns throughout the engagement. After the close of the war he went into the revenue cutter service and was retired in 1902. He later became supervisor of anchorages at the port of New York.

STOLYPIN, PETER ARKADEVITCH. Prime minister of Russia, died from assassination at Kief, September 18, 1911. He was born in 1863 and was educated at the University of St. Petersburg, graduating in 1884. He was born of old Muscovite stock in a moderate position in life. He early demonstrated ability in politics and served in the ministries of the interior and agriculture. In 1889 he was made marshal of the Provincial nobility, in 1902 vice-governor of Grodno and in 1903 governor of Saratov. He first came into prominence while holding the latter post. In 1905 an attempt was made to kill him. Three shots were fired by an assassin but he was not hit. Speaking of his service at this spot he asserted that it had been his aim to cultivate a class of pleasant landowners and give them real weight in the local government of their communes. He was reproached for establishing a new university in the province and replied that it was only by introducing the higher education into the provinces that the work of developing law and order would be successfully advanced in Russia. In May, 1906, he was called by the czar to St. Petersburg and made minister of the interior in the Goremykin ministry. He remained but three months in this office, but during this time he was savagely assailed on the floor of the Duma as a tyrant and murderer and a monster of cruelty unparalleled in history. He came into office with the rising wave of revolutionary terrorism which deluged Russia with blood and filled it with ruin. He put this down with a strong hand and the police and soldiers were allowed to go as far as they wished in repressive measures in the disturbed districts. Where suspects were convicted of revolutionary or terrorist crimes wholesale executions were mercilessly carried out. The attacks of the Duma did not interfere with the czar's confidence in Stolypin and in July, 1906, he was made prime minister. Despite annual rumors of his impending downfall he weathered every political storm and remained at the time of his death more firmly intrenched in office than ever before. The first Duma with its large, popularly chosen and radical membership, having proved unmanageable, was dissolved on July 22, 1906. A second one was selected and met in March, 1907, but this in its character differed little from its predecessor. In June Stolypin accused most of the Socialist members of being parties to the revolutionary propaganda in the army and navy and demanded their immediate suspension. The Duma refused to act without an investigation and was thereupon dissolved by the czar. For the choice of the third Duma the premier prepared an electoral law which, while it still preserved the semblance of a general franchise, made it certain that the membership would be representative, in the main, of what may be called the conservative classes of the people. This body was chosen at the elections in September, 1907, and although it proved by no means so amenable to ministerial dictation as its projectors hoped, on the whole it worked well and no attempt has been made to dissolve it. In 1908 Stolypin's enemies rejoiced at what they declared his impending deposition from office. Again in 1909 he was said to be completely out of favor with the czar and on the point of retirement. Nothing happened, however, until March 19, 1911, when he handed in his resignation. This was the result of his attitude on the question of extending the

Zemstvo or local council system to the western provinces, which was one of the methods by which Stolypin hoped to develop the faculty of self-government in the people. The Duma had passed the bill without difficulty, but the Council of the Empire, made up largely of grand dukes, members of the nobility, and high officials, rejected it. The leaders of the council urged the czar to stand firm in its support. Contrary to their anticipations, however, the czar yielded to the demands of his premier in regard to the measure, and also granted his demand that Durnovo and Trepoff, the most aggressive members of the council, should be eliminated. Only on these conditions would Stolypin consent to remain in office. He suspended the sessions of Parliament, established his provincial council system by imperial decree, and then called the two parliamentary houses back to their duties.

Under Stolypin's rule the reign of terror of 1906 and 1908 was gradually put down. The country began to prosper materially, the army was reorganized, and the building of a new navy to take the place of the one destroyed by the war with Japan was begun. An annual surplus of many million roubles was developed in the imperial treasury. Shortly after Stolypin's appointment as premier, a second attempt was made on his life. This was on August 25, 1906, when a bomb was thrown into his house at Aptekarski Island, where a reception was in progress. Stolypin himself and two of his daughters were wounded and thirty persons were killed outright, including two of the four bomb-throwers, and several were wounded.

Stolypin was classed in politics as an Octobrist, but in reality was above party affiliation and used such combinations as he could effect to carry out his will. He has been described by one of his critics as "attempting the impossible feat of reconciling absolutism and constitutionalism." During various periods of his career he was hated by all parties, and was accused of nearly every crime except dishonesty. In the year or two preceding his death, however, he had begun to acquire admiration and respect if not affection not only in Russia but throughout Europe. He restored tranquillity and prosperity to the country after the exhaustion of foreign war and domestic disorder. He was a man of remarkable enlightenment and clearness of intellect. He saw the inevitable drift of the age toward the rule of the people and the overthrow of arbitrary government, and when he came into power he made his policy the guidance of this tendency. This resulted in the hatred of the people, because he retarded the development of the parliamentary system for Russia and put down popular violence and disorder with ruthless severity. At the same time the reactionary element in the empire were his deadly foes, because it was plain that under his leadership the parliamentary system would gain a position in the government from which it could never be thrown down and that the people of Russia were beginning a real practical education for self-government. For the political effects of Stolypin's death, see RUSSIA.

STORM KING TUNNEL. See AQUEDUCTS.
STRAITS SETTLEMENTS. A British crown colony, made up of the island of Singapore (206 sq. miles, 228,555 inhabitants in

1901), Penang (107 sq. miles, 128,830), Malacca (659 sq. miles, 95,487), Province Wellesley (288 and 115,284), the Dindings (260 and 4133), Labuan (31 and 8286), Christmas Island (56 and 12,000), Cocos Islands (9 and 700). Total area, 1646 sq. miles; total population (1901), 572,249; estimate of 1911, 650,000. Singapore, with 193,089 inhabitants in 1901, is the capital. Chinese immigrants entering Singapore in 1910, 216,321, against 64,569 in 1909; entering Penang, 59,414, an increase of 37 per cent. over 1909. The increase was due to poor harvests in southern China and the inducements held out to labor by proprietors of rubber estates. Cattle imported into Singapore in 1910, 23,621 (15,062 in 1909); swine, 87,895 (66,797). In 1910, 104,800 tons of copra were exported; 64,000 tons of sago, 62,000 of arecanuts, 61,300 of tin, 40,800 of tapicoa, 29,000 of gambier, 26,600 of rattans, 28,400 of pepper, 3600 of gutta percha, 25,300 of inferior gutta percha, 2700 of rubber, 6500 of hides. Total imports and exports (1909), 313,358,427 and 281,183,021 Straits-Settlements dollars respectively (1 S.S. dollar=56.7758½ cents); intersettlement trade, 14,500,548 and 13,073,446. The trade of Singapore in 1909 showed imports amounting to £26,713,900; exports, £23,022,100 (including exports from Christmas Island £263,702); of Penang, £10,874,100 and £10,631,600; Malacca £507,000 and £544,000; Labuan, £155,200 and £131,700.

Articles of total trade, exclusive of intersettlement, in 1909 are given below:

Imports		Exports	
Rice	£4,328,760	Tin	£8,248,128
Cottons	1,446,926	Spices	1,358,529
Opium	1,025,209	Gums	2,397,634
Fish	1,125,278	Copra	1,161,872
Coal	756,844	Gambier	649,796
Tobacco	872,926	Rattans	456,723
Sugar	774,454	Hides	449,912
Machinery ...	624,837	Pineapples ...	250,944
Petroleum ...	352,188	Tapicoa	823,567

Entered at the ports of the colony in 1909, 9443 vessels, of 11,095,460 tons; native craft, 17,505, of 675,762. Cleared, 9446 vessels, of 11,096,894 tons; native craft, 17,512, of 671,439. Railways in operation, 567 miles. The estimated revenue (1909) was placed at £1,026,083 and the expenditure at £996,652. A governor (1911, Sir Arthur Henderson Young) administers the colony; the separate states have resident councillors—R. N. Bland for Penang, W. Evans for Malacca, M. S. H. McArthur for Labuan.

STRETTON, HESBA. An English novelist, died October 9, 1911. She was born in Shropshire in 1841, where her father was a bookseller. The name Hesba Stretton was a pseudonym, but was used also in private life, and there is a dispute as to her real name. She wrote for Charles Dickens from 1859 until his death. She afterwards produced many stories of a religious and philanthropic trend, which were translated into many foreign languages.

Among her published writings are *The Doctor's Dilemma*; *Hester Morley's Promise*; *Half Brothers*; *Jessica's First Prayer*; *The Soul of Honor*, and *The Highway of Sorrow*.

STRIKES. The year 1911 was not a year of extensive labor disturbance in the United States, differing materially in this respect from the preceding year. In European countries, however, there was a very unusual amount of labor unrest. This was less notable on the continent than in England, where the great international strike of the seamen centred. There was a great deal of disturbance in Spain and Portugal, attended with strikes and riots, but these were primarily political in character rather than industrial. The chief economic cause of strikes was probably the increased cost of living (see PRICES). It is a well-established economic principle that in times of rising prices wages increase less rapidly than the cost of commodities. Another undoubted cause is the increasing class consciousness of the working population, resulting in the growth of trade unionism and more extensive concerted action for the betterment of wages and other conditions of labor. See ARBITRATION and CONCILIATION, INDUSTRIAL; and TRADE UNIONS.

INTERNATIONAL. The International Transport Workers' Federation has developed rapidly during the past seven years. It has extended its affiliations so as to include the principal countries of Europe and the United States. Its associated organizations are more or less important in 300 harbors in Europe and America; they include forty-four separate national unions with 600,000 or 700,000 members in eighteen different countries. It publishes the *Correspondence Bulletin* in five different languages. While not strongly inclined to fighting methods and favoring passive resistance and boycotts, it is not unwilling to resort to strikes to enforce its demands. It claims no authority to call strikes in any particular country, awaiting requests from some national organization. Conferences were held at Copenhagen in August and at Antwerp in November, 1910, and finally at Antwerp again in March, 1911.

At this last conference it was decided to appoint a defense committee to investigate the situation in England and if necessary to take steps preparatory to an international strike. Representatives were present from the United States, Germany, Sweden, Norway, Denmark, Holland, and Belgium. The German representatives declared that they could not be expected to adhere to the proposed strike because of recent increases in their wages. The French unions were not favorable because they had just completed several strikes at French ports and desired further to perfect their organizations. The English representatives declared that their demands were for a minimum monthly wage of £4 10s., uniform rates of pay for crews engaged in steamer service, abolition of medical examination, the recognition of the union, and a closed shop. The conference agreed that if further efforts at the betterment of conditions in English ports failed, an international strike, which had been threatened for several years, should be called. The strength of the seamen had been greatly increased by the organization of the International Seamen's and Firemen's Union, whereby the importation of strike breakers or "blacklegs" from the ports of one

country to those of another by shipowners was rendered difficult. Moreover, the organization of dockmen and cargo handlers under the International Transport Workers' Federation had greatly increased the amount of the trade union influence in principal ports.

The demands of the British seamen not being granted, the threatened international strike was declared on June 14. The ports affected included London, Liverpool, Manchester, and all other principal ports of Great Britain and the ports of Holland and Belgium. By June 20 ships were being detained in a great many different ports for lack of crews. The strike of the seamen was soon followed in Great Britain by strikes of transport workers, including dockmen, carters, cargomen, and stewards. More than 100,000 men were out. Although shipowners at various ports granted the demands for higher wages and secured seamen and other employees, the situation grew worse until the end of June, after which there was a more or less steady improvement. The usual wages of British seamen had been £4 per month. The shipowners generally granted increases of 10s., though in a few cases the increases were only 5s. The total number of seamen and firemen affected was about 150,000 and the total annual increase in wages was estimated at nearly £600,000. The strike of the dockers and carters, which was most serious in July and August and was limited in the main to English ports, was attended by considerable violence, rioting, and even loss of life at several ports, especially Liverpool, Manchester, and Glasgow. This strike, being accompanied by the English railway strike, brought many of the larger cities face to face with a possible shortage of food supplies. In London the stock of chilled and frozen meats was nearly exhausted and prices were doubled. There was also a scarcity of provisions and fruits and at the same time the fish porters threatened to strike. The Transport Workers' strikes were officially ended in August, and gradually simmered out, an advance in wages being secured in most cases. Final settlements were not reached in some cases, however, until the close of the year.

The disturbance at Amsterdam was greater than at any other port outside Great Britain. There was a great deal of rioting and a conspicuous loss of life, necessitating an extensive employment of military force. The seamen's strike at that port continued up to the first of August without any distinct gain by the strikers. At St. Petersburg some 12,000 laborers employed on timber and coal docks struck about August 1, for a 50 per cent. increase in pay. The employers announced their willingness to compromise and the men were forced to accept their offer because of lack of strike funds. Antwerp, Rotterdam, New York, and Boston also experienced disturbances. Everywhere the strikers were at least partially victorious. Moreover, the strength of union and mutual understanding among all branches of workers engaged in the international carrying trade was increased.

UNITED STATES. Chicago Garment Makers. This notable strike, involving 30,000 workers, began in October, 1910. The strike began with the cutters employed by the Hart, Schaffner Marx Co., there being a disagreement of a fraction of a cent in piece-wage rates. By common consent men and women speaking six languages

and employed in many shops stopped work on learning that the cutters were out. The grievances were small but numerous and had occasioned widespread dissatisfaction. There was almost no disorder and numerous attempts by outside parties were made to bring about a settlement. The principal employer was the company mentioned, which employed 10,000 workers. This company at the middle of January reached a basis for arbitration with its employees, who returned to work at once. This basis included the following points: Strikers should be taken back regardless of violence; there should be no discrimination against members of the United Garment-Workers of America in the reemployment of strikers; all striking employees were to be taken back within ten days; a board of arbitration of three was to be chosen at once to settle the points in dispute and to fix a method for the settlement of future grievances; the findings of the majority of this board were to be binding on both parties. The other 20,000 strikers were finally exhausted; they were literally starved into submission, giving up the fight on February 3. They decided to accept whatever terms the employers, who were organized in two associations, would give. Although undoubtedly forced by circumstances to this position the strikers had cause for suspecting the loyalty of some officers of the union. This suspicion also existed in the minds of a body of public-spirited citizens and other union labor leaders who had worked long and honestly to bring about an arbitration of differences and who were nearly successful, but who were not consulted when the strike was ended.

HARRIMAN LINES. That the tendency toward combination has affected the organization of trade unions is shown by the federation of shop crafts among railway workers. The main object of this federation is to improve the strength of the various unions. A number of important railroad managers have recognized the federation as a legitimate organization and carry on relations with employees through the representatives of the federation. In June such a federation was formed on the Harriman lines by a conference of union representatives at Salt Lake City. At about the same time similar federations were formed on the Illinois Central, the Rock Island, and the Frisco systems. The managers of the Rock Island shortly thereafter signed the federate agreement. The managers of the Harriman lines, however, refused. After several fruitless conferences, at which Mr. Kruttschnitt, vice-president of the Harriman lines, steadily maintained a position of opposition, a strike was declared on the Harriman lines and the Illinois Central on September 30. This was a determined struggle. On the one hand Mr. James W. Kline, president of the International Brotherhood of Blacksmiths and Helpers, declared: "If we win this strike all the railroads in the United States will submit to a federation." On the other hand Mr. Kruttschnitt said: "We might as well turn over our roads to the men as grant their demands." On the one hand the union leaders declared that the individual unions were too weak to contend on equal terms with the managers of the great railroads. On the other hand the railway managers looked upon the federation as a trust with inherent powers of extortion and intolerance. The demands of the federation included: The closed shop; the right of the

organization to designate the men to be laid off; the right to say whether any other employee shall be discharged or employed and the abandonment of the bonus system. Mr. Kruttschnitt issued a formal statement in which he laid stress on the good wages paid, the hospital, pension, and other benefits provided, and pointed out the evils of recognizing the federation in so far as this would interfere with the effective operation of the many parts and branches of a great railway system. President Kline replied that Mr. Kruttschnitt had overlooked "the damnable physical examinations, the personal-record system, and the rank discriminations practiced by the railroads." He held that the federation was needed for the protection of the men and would prove economical and convenient from the standpoint of railroad management, since one committee would replace several. The strike continued beyond the close of the year.

WESTMORELAND MINERS. The strike begun in the Irwin-Greensburg field in Westmoreland county, Pennsylvania, in March, 1910, continued until July 5, 1911. At its height some 17,000 miners were out; by November, 1910, two-thirds of these had gone elsewhere; the remainder kept up the fight. This was the longest considerable strike ever recorded in this country. The strikers were backed up by the United Mine Workers, while the mine owners and operators maintained an organized opposition. The cause of the strike was the effort to unionize the field. The conditions in the Irwin coal field are similar to those in the Pittsburgh field as regards quality of vein. The latter field, however, is unionized and wages and conditions are determined in part by the representatives of the men. They were 20 per cent. better than at Irwin. Thus skilled labor in the Pittsburgh field received \$2.70 to \$2.80 for an eight-hour day, while at Irwin it received \$2.40 to \$2.60 for a ten-hour day. Unskilled labor at Pittsburgh received \$2.49 for eight hours and at Irwin \$1.60 to \$2.00 for ten hours. The miners working by the ton claimed that they were being constantly exploited by fraudulent weight records. They had no representative as a check on the operators' weighmen. Moreover, the miners objected to the requirement that they remove all clay and slate and make roads in the mines out of their own time. They also objected to being forced to bear the increase in expense due to new kinds of powder and of safety lamp. Considerable irritation was due also to the fact that the operators were not only employers but also landlords and storekeepers. It was protested that the operators exploited them as miners and then took a scandalous advantage of them as renters and patrons of the company stores. A rental of \$168 per year was charged for houses that did not cost over \$500. The miners also asserted that undue pressure was brought to bear upon them at election time to force them to cast their ballots as directed by their employers. The strikers received about \$20.00 per week from the United Mine Workers, or a total of more than \$1,000,000, as strike benefit. The real cause of the cessation of the strike was the unwillingness of the International Executive Board of the United Mine Workers to continue a struggle which held so little promise of success. Had the coal market been brisk the operators could have been brought to terms, but with a slack

market their stubborn resistance finally won. The losses to the operators included \$500,000 for private police, loss due to decreased output, and to the introduction of a lower grade of workers. One of the remarkable features of this strike was the tenacity with which a heterogeneous mass of immigrants speaking several languages held together in a common cause under desperate circumstances.

NEW YORK STREET CLEANERS. The strike of about 1200 night collectors of ashes and garbage in New York was begun on November 5. A few days later about 700 other drivers, together with some street sweepers, went out. They protested against the night work which had been instituted in April preceding. They claimed that they were required to work nine or ten hours per day instead of the eight hours for which they were paid; they complained that the work was hard and heavy, since at night all the lifting must be done by them single-handed, instead of with the aid of janitors; they complained also of grafting by district bosses and foremen, and of annoying rules and regulations. The drivers also demanded an increase of pay. Drivers and hostlers received \$800 per year, sweepers \$780, and stable men \$760. These sums were declared insufficient to maintain a suitable standard of living in New York. Mayor Gaynor very stiffly refused to entertain any suggestions for arbitration; he refused to confer with representatives of the strikers, and told them sharply that if they did not like their work they had better quit. Men were at once recruited from a list of some 9000 names on a reserve civil service list. By November 20, the department stated that it had 922 civil service men at work. At first, however, it was necessary to have two or even three men to a cart instead of one. Other recruits were brought from Boston, Philadelphia, Baltimore, Buffalo, Pittsburgh, and elsewhere. The cost of such recruiting, including transportation, food, and care, was \$136,000 during the first six days. In spite of very prompt and vigorous action by Superintendent Edwards the situation became acute, especially in the poorer quarters, where deep piles of refuse accumulated, polluting the air, choking traffic, and endangering the lives of thousands. There was some rioting on Sunday, November 12, and one driver was killed by chimney bricks purposely toppled over on him. The strikers, who were employed under the civil service rules, were tried and dismissed. Their places were gradually filled and the work of the department in time resumed its normal condition.

The most interesting feature of this strike was that it was the first notable strike among public employees in this country. The right of such employees to strike, especially when engaged in a business upon which the public health and welfare so intimately depend, was very widely denied. Labor leaders, on the other hand, declared that if such rights be denied then public employees would be denied a right which belongs to every free man. In any case it was generally agreed that some method of arbitration must be formulated whereby such interruptions of the public service will be prevented.

GRAND RAPIDS FURNITURE WORKERS. Some 6000 furniture workers in thirty-eight factories in Grand Rapids, Mich., were out on strike for seventeen weeks, the strike ending early in

September. The men requested a nine-hour day instead of ten, a 10 per cent. increase in wages, and the elimination of piece work. A commission of citizens investigated the conditions and found that the average wage was \$11.27 per week; this was not deemed a living wage. They found, however, that wages had increased 16 per cent. in the last five years. The commission recommended that the nine-hour day be tried, and reported that the piece system was open to abuse. Six employers compromised and resumed business on a nine-hour basis. The others opened recruiting stations in neighboring cities and secured injunctions against picketing. There was almost no disturbance, about 30 of the strikers enrolling among the one hundred special police to maintain order. The contest then became one of endurance, in which employers proved the stronger. Strike benefits of \$4 per week for unmarried men and \$5 per week for married men were given to the strikers. The employers' losses included reduction of output, inability to fill orders, and the disorganization of selling departments. Moreover, there was much loss to the community, especially to merchants; the cost of extra police to the city resulted in a reduction in the appropriations for public schools and other improvements.

GREAT BRITAIN. RAILWAY STRIKE. The most impressive of the English strikes was that of the railway trade unions, headed by the Amalgamated Society of Railway Servants, which began on August 17, after only one day's notice. About 200,000 men were out. Although there was not a complete cessation of transportation, the situation, largely on account of the existing international strike, became sufficiently serious to cause real concern. The government, alarmed at the state of affairs and fearing foreign complications, intervened. Troops were stationed at principal points. Mr. Asquith declared that in the interests of the public cessation of traffic would not be permitted and promised a special commission to inquire into the trouble. By the 21st the men were nearly all back at work. The most important cause of the strike was the dissatisfaction with the scheme of conciliation drawn up in 1907. The men claimed that the company had not lived up to the spirit of that plan. The company, on the other hand, claimed that the men by striking had completely broken faith with reference to the conciliation scheme. This scheme established two grades of boards to which the men elected representatives. One of these dealt with sectional questions, and any matters not settled by it were sent to the second or central board. These appeals were a source of aggravating delay.

The conditions of temporary settlement were that the men should return to work and that the company should reemploy them without penalty; that the conciliation boards should take up the questions in dispute at once and that a special railway inquiry commission should be appointed. This commission was at once appointed by the government and in October reported a series of compromise propositions, designed to remove the objections to the conciliation scheme. The proposals sought to facilitate a preliminary conference between the men and the companies and to make more effective the work of new boards, somewhat similar to the sectional boards. The central board was abolished and it was provided that in case of a deadlock on a sectional board an independent

chairman should be chosen to effect a final decision. As to recognition of the unions, which was an important demand, the commissioners declared that the railways, on account of their great responsibilities, must not permit any intervention between them and their men on the subjects of discipline and management. The great discontent of the men with the report led to a series of conferences early in December under the auspices of the Board of Trade, at which it was provided that the men might be represented at the meetings of the sectional boards by a secretary who might be a trade union official. Other minor compromises were effected, but dissatisfaction of labor leaders continued, primarily because full recognition of the unions was not granted. Consequently a referendum was held late in December on the question whether they should accept the findings of the commission or whether the men should prepare to strike again to secure complete recognition. At the very close of the year it was announced that the vote was overwhelmingly in favor of a strike and that the companies were making preparations against a general strike.

IRISH RAILWAY STRIKE. A thoroughly ineffective and apparently unjustifiable strike was ordered by railway men on one of the Irish roads in September. This was due to efforts of the men to prevent the road from handling goods consigned to a timber company employing non-union men. Though some support was given by railway men on other lines the strike fizzled out in a few days. This strike aroused great attention because of the rather revolutionary character of the agitation accompanying it. The tactics of the principal leader, one Larkin, were copied after the Syndicalist methods in France.

WELSH MINERS. The strike begun by about 12,500 employees of the Cambrian Coal Trust in October, 1910, continued through the greater part of 1911. The principal question in dispute was whether miners employed on thin veins and under unfavorable conditions should be guaranteed a minimum rate of pay. Although this strike was illegal, having been begun in defiance of a trade agreement, it was supported by the South Wales Miners' Federation. It was attended by much rioting in March and at various other times until its settlement in August. Indeed the total cost of extra police service to the local and the national authorities was nearly \$60,000. A basis of settlement, which was agreed upon by representatives of the strikers and the employers in May, was overwhelmingly rejected by the strikers, who demanded that the Miners' Federation of Great Britain order a general strike to secure the establishment of a minimum wage. The South Wales Federation supported the strikers by a strike benefit of £3,000 per week. When, however, the executive committee of the Great Britain Federation declared that the issue should be submitted to arbitration, the South Wales Federation declared that it would not continue its support after the middle of July. For the continuance of the controversy after the strike, see **MINIMUM WAGE**.

LANCASHIRE COTTON LOCKOUT. On December 28 a lockout was begun in the mills of the Federation of Master Cotton Spinners, involving about 160,000 weavers; an equal number of spinners were reduced to half-time. The trouble

was due to the inability of the unions to either force three employees in different mills to join the union or to force the employers to discharge the non-union workers. The weavers made a demand for an increase of 5 per cent. in wages as a condition of settlement. The strikers were said to have a strike fund of \$1,250,000; they were also given a strike benefit of \$125,000 per week for three weeks by the Federation of Trades Unions. The manufacturers had a reserve fund estimated at \$10,000,000. The loss of wages exceeded \$1,000,000 per week. Arrangements were at once made for the intervention of Sir George Askwith of the Industrial Council. See **ARBITRATION AND CONCILIATION, INDUSTRIAL**.

CAUSES. The widespread discontent in British labor seemed difficult to explain on account of the great amount of progressive legislation for the betterment of labor conditions which has been enacted in recent years. Among the causes mentioned were: Increased unemployment, increase of wages in three and decrease in seven of the last ten years; increasing pauperism, the total of indoor and outdoor paupers in 1900 being 702,000, but in 1910, 807,000; increased "speeding up" through the adoption of American methods; rising prices.

SUBWAY TRANSIT. See **ELECTRIC RAILWAYS**.

SUDAN, ANGLO-EGYPTIAN. The Sudan provinces, administered under the provisions of a convention (1899) between the British and Egyptian governments, are thirteen in number. The area is estimated at 950,000 sq. miles and the population at 2,500,000. The capital is Khartum, with a population in 1909 of 20,956; Omdurman had 42,779; Khartum North, 36,294. The schools directly under the central authority of the education department are kuttabs (elementary vernacular schools), primary schools, upper school, training college, and instructional workshops. Pupils in all schools in 1909-10 numbered 3540. The kuttabs form the basis of the educational system of the country, and are politically the most important part of the work of the department. The primary schools are for sons of government employees and the better class of natives; the upper school (Gordon College) is for technical and professional work. The raising of the Assuan Dam, by increasing the irrigated area, will tend to improve the possibilities of the Sudan as a cotton-growing country. One of the country's chief needs is an efficient system of fire-protection for the large and valuable forests. Lack of population, and, therefore, of labor for the agricultural districts, is one of the great obstacles to rapid development of the natural resources. The total area returned as cultivated in 1909 was 1,538,765 feddans (1,106,175 in 1908), of which 102,073 were artificially irrigated, 1,221,287 under rain-grown crops, and 215,405 flooded land. The trade in 1909 was as follows: Public imports, £E1,119,072; government imports, £E656,885; mdse., in transit inwards, £E6913. Exports, £E673,902; reexports, £E60,941; mdse. in transit outwards, £E23,709. Specie imports, £E44,158. The export of dura increased from £E7925 in 1906 to £E128,000 in the first nine months of 1909. The cattle trade is one of the most valuable resources of the country, but has been

hindered by the continual recurrence of cattle plague.

At the bottom of all problems of economic development of this country lies the question of transportation. During the decade subsequent to the completion of the railway to Khartum considerable capital expenditure was incurred both on extensions and on improvements. Total length of railways in operation in 1911, 1725 kilometers (1072 miles); of telegraph lines, 7934 kilometers; number of post offices, 57.

The revenue in 1910 was estimated at £E1,425,000 (contribution by Egyptian government, £E325,000), and the expenditure at £E1,425,000 (£E127,000 paid to Egyptian government for maintenance of Egyptian army in the Sudan). In 1910 a change in the system of administration was instituted, a duly constituted council being substituted for the informal body previously assembled by the governor-general. The governor-general (1911, Sir F. Reginald Wingate) is Sirdar of the Egyptian army.

SUDANESE NEGROES. See **ANTHROPOLOGY**.

SUGAR. The sugar beet crop in the United States was much above the average of the previous five years and was the largest ever grown. The value of the sugar and pulp from this crop was estimated at \$90,000,000, the highest previous value being about \$60,000,000 in 1909. The value of the sugar from cane is estimated at about \$45,000,000, which is far above the highest previous figures, and 58 per cent. over the five-year average. The crop of sugar from cane in continental United States is given as 308,000 tons, as compared with 311,000 in 1910, and of beet sugar at 530,000 tons, as compared with 455,000 tons in 1910. The total sugar production in continental United States was, therefore, 838,000 tons.

The world's production of cane sugar in the year 1911-12 is estimated at 8,765,000 tons, as compared with 8,412,908 tons the previous year, and of beet sugar 6,580,000 tons, as compared with 8,550,220 in 1910. This gives a total world production of cane and beet sugar of 15,345,000 tons, as compared with 16,963,128 tons in 1910, an apparent shortage of about 1,600,000 tons under 1910. There was a decrease of nearly 2,000,000 tons in the beet sugar crop. The average world production in 1905-09 was 14,367,000 tons, 5 per cent. of which was grown in the United States. The production in 1911 in the principal sugar-growing countries was as follows: British India, 2,100,000 tons; Russia, 2,000,000; Cuba, 1,800,000; Java, 1,395,000; Germany, 1,350,000; Austria-Hungary, 1,150,000; France, 550,000; Hawaii, 500,000; Africa, 385,000; Porto Rico, 350,000; West Indies and Lesser Antilles, 321,000; Australia and Fiji Islands, 272,000; Brazil, 260,000; Netherlands, 255,000; Belgium, 235,000; Philippines, 225,000; Formosa, 220,000; Argentina, 170,000; Peru, 150,000; Mexico, 140,000; Demarara, 110,000; Central America, 22,000; Spain, 21,000; Other European countries, 510,000 tons. The sugar produced in British India is all consumed locally; that given for the Philippines is the amount exported.

The imports of sugar and molasses into the United States in 1911 amounted to \$98,000,000, a decline over the preceding year. Experiments made in growing sugar beets in Hawaii, on the island of Lanai, resulted in roots of very good quality. The island is too dry for sugar cane,

with no provision for irrigation, but the natural rainfall suffices for the beet crop.

The past forty years have witnessed a remarkable increase in the productivity of the sugar beet in Germany. The amount of sugar eventually obtained per acre at the present time is more than double what it was in 1871-1876. At that period the percentage of sugar extracted averaged 8.58, while in 1906-1911 the average was 15.55 per cent.; and the net amount of sugar obtained per acre averaged 16.8 cwt. in the first period and 37.1 cwt. in the recent years. While much of the result is due to improved technical processes in the factories, it is also due in part to improvement in the varieties of beets. The increase in yield of roots has not been large.

Sugar-beet seed is not grown in the United States. In 1910 10,307,075 lbs. of seed, worth \$668,446, was imported. The Department of Agriculture finds that the imported seed is deteriorating, and is conducting experiments in its production in this country.

Investigations in the Philippines indicate that the nipa palm possesses considerable economic value for the production of sugar. The sap has long been a source of some sugar and many alcoholic drinks for native use. The palm grows wild on land otherwise valueless for agricultural purposes, propagating itself freely and producing sap for fifty years or more. It is believed that in the Philippines sugar can be made from the nipa palm more economically than from sugar cane.

SUGAR TRUST. See TRUSTS.

SULPHUR. The total production of sulphur in 1910 was 255,534 long tons, valued at \$4,605,112, as compared with 239,312 long tons, valued at \$4,432,066 in 1909, an increase of 16,122 in quantity and \$173,046 in value. Although sulphur is produced in four States, Louisiana, Utah, Nevada, and Wyoming, the production of all except Louisiana is practically negligible.

There were imported into the United States in 1910 30,833 long tons of sulphur, including crude sulphur, refined sulphur, flowers of sulphur, and all other kinds. The total value of these imports was \$558,611. There were exported in 1910 30,742 long tons of sulphur, valued at \$552,941. In 1909 this exportation was 37,142 long tons, valued at \$736,928.

WORLD'S PRODUCTION. Italy is the leading country in the world in the production of silver. There were produced in 1909 2,827,455 metric tons, valued at \$6,275,630. The production of silver in Japan has increased in recent years. In 1908 it amounted to 33,785 long tons, valued at \$393,533. Japan occupies third place among the sulphur-producing countries of the world. Small deposits of sulphur are found in Russia, Austria-Hungary, Greece, southern France, Spain, and in various parts of Asia, Africa, and North and South America.

Important improvements in the mining of sulphur in 1911 were perfected at the sulphur mine in Calcasieu Parish, La. Here the sulphur was apparently deposited in the cone of a great geyser, which dates back to the tertiary period and is contained in a limestone formation of about 70 per cent. sulphur to 30 per cent. limestone. The sulphur from this mine is extracted by a system of boilers and superheaters. The latter has vertical, cylindrical receptacles about 4 feet in diameter by 16 feet

in height containing a series of shallow trays over which water runs and is thus brought into intimate contact with live steam from the boilers. The sulphur wells are sunk in groups, the individual wells being placed 50 to 100 feet apart. The sulphur melted by the contact of steam flows from the wells in liquid form in a purity of about 99½ per cent. This is collected and stored in large bins. This process is the invention of Mr. Herbert Frasch.

SUN. See ASTRONOMY.

SUN SPOTS. See ASTRONOMY.

SUN YAT-SEN. The first president of the provisional republic of China. He was born in 1865 in Canton, of Chinese parents. In his boyhood he was taken to Hawaii, where he attended the Iolani College under the charge of Bishop Willis. He there became a convert to Christianity, and on his return to China met with so much opposition and even persecution on account of his faith that he returned again to Hawaii. After some time spent in the islands he again returned to China. For several years he studied medicine at Canton under the medical missionary, Dr. Ken, of the American Presbyterian mission, and later in the College of Medicine at Hongkong. After receiving his diploma in 1892 he began the practice of medicine in Macao. He here became associated in the political movement carried on by the "Young China" party, which, while it at first sought peaceful methods of reform, fell later into an anti-dynastic movement. Threatened with danger of arrest, he was compelled for the second time to leave China. He returned to Honolulu, where he remained for a short time in 1896. He soon went to San Francisco and thence to England, where he made his home in London with friends whom he had known in China. The secret agents of the Chinese authorities secured his arrest, and after being lured into the Chinese legation he was forcibly imprisoned for fourteen days on the charge of being insane. The matter was brought by an English friend to the attention of the British Foreign Office, and Lord Salisbury demanded his release. This demand was complied with. From this time Dr. Sun devoted himself to the task of ridding China of the Manchu domination. He traveled over England and visited the United States and Hawaii. The Chinese government placed a price of \$50,000 on his head and the empress dowager expressed herself as willing to forgive all others, but not him. He organized the revolution by secretly drilling Chinese in halls under American officers and formed the nucleus of an army of men who went to China and there gathered and led recruits. The Chinese in the United States for the most part sympathized with his cause and freely gave money. In 1906 he printed for private circulation an appeal to Americans for aid, as special friends of China. In this appeal he said: "We must appeal to the people of the United States in particular for your sympathy and support, either moral or material, because you are the pioneers of Western civilization in Japan; because we intend to model our new government after yours; and above all, because you are the champions of liberty and democracy. We hope we may find many Lafayettes among you." Dr. Sun was active throughout the United States gathering money for the cause of the revolution during

1911. He appeared in various cities and obtained large sums from Chinese and others. The events leading up to his election as president of the new republic are discussed in the article **CHINESE EMPIRE**.

SURGERY. While many new operations and operative methods have been introduced into the field of general and special surgery during the past few years, the general tendency has been to develop more exact methods of diagnosis, rather than the cultivation of mere manual dexterity in the use of the knife. The pathological laboratory is called into play at every step, and the X-ray is used to diagnose not only bony lesions, but obscure conditions of the intestines, kidneys, and other abdominal organs. By previously administering the bismuth salts, the position and condition of the stomach and the intestines can be definitely ascertained.

Microscopical examinations of the blood, urine, and cerebro-spinal fluid throw much light on hitherto little understood conditions; and the patient is so well safeguarded by early and exact diagnosis that much of the former fear of operation has disappeared. Indeed, the prognosis is now frequently determined before the patient goes on the table. Together with all this, there has grown up a better appreciation of the powers of nature to combat infection, so that prolonged drainage of operative wounds, with the resulting hideous scars, is rare.

Among the new procedures during 1911 was the use of the cystoscope in the exploration of serous cavities. Jacobæus introduced the cystoscope through a trochar in seventeen cases of abdominal ascites, after draining off the fluid and inflating the cavity with filtered air. In several instances he was able to diagnose cancer—metastases on the surface of the liver and once cirrhosis of the liver was recognized. When there is no ascites present the use of the trochar may result in injury to the intestine, and in such cases extreme caution is necessary.

Puncture of the heart cavity was done by Milne in a case of rheumatic heart disease with defective valves and dilatation of the ventricles. The patient had become almost unconscious and pulseless, and it was found impossible to draw blood from the veins of the arm. Milne thereupon thrust a cannula through the chest wall into the interior of the heart and elicited a flow of thick, dark blood. The patient revived, but died several hours later.

Operations upon the chest are difficult on account of the admission of air into the pleural cavity (pneumothorax), whereby the lung is collapsed and retracted out of reach. To overcome this difficulty an air-tight box has been devised by Sauerbruch, in which the patient (except the head) and surgeon are enclosed. Operations can thus be done under negative pressure, which Sauerbruch obtains by exhausting the necessary amount of air and thus creating a partial vacuum. The method is useful in operating on wounds of the lungs, empyemia, abscess of the lung, traumatic pneumothorax, and emphysema, ruptures of the bronchial tubes, in the removal of tumors, extraction of foreign bodies in the bronchi, etc.

Transplantation surgery was practiced to some extent during 1911, following Carrell's experiments at the Rockefeller Institute, which showed that it was possible to transfer organs or limbs from one animal to another, and that

it was possible to graft portions of arteries kept alive for weeks or months in preservative fluids. Fischer and Schmieder repaired wounded arteries with portions of veins, and found that the vein so transplanted soon took on the characteristics of an arterial wall. Transplantation of the bone *en masse* has long been practiced.

Section of the posterior spinal nerve roots was done by a number of surgeons (see **RHIZOTOMY**). Winslow performed the operation to control athetoid and choreiform movements of the limbs, which are characteristic of certain diseases of the brain. His reports indicate only a partial success. The difficulties of the procedure are considerable and the technique is not thoroughly elaborated.

Appendicostomy consists in anchoring the vermiform appendix to the lips of an incision in the abdominal wall. The appendix is opened, and access to the interior of the bowel obtained for as long a period as necessary. This operation was done in cases of intractable amebiasis, and in ulcerative conditions of the large intestine. Through the opening thus obtained lavage of the bowel was practiced and various medicinal agents introduced. The feces are discharged through the opening thus made and the lower bowel placed at rest. Appendicostomy was advocated by Allaben and Groves in cases of acute peritonitis, for the introduction of saline solutions. Groves says that the procedure in diffuse peritonitis allows the introduction of unlimited quantities of normal saline solution after operation, that it acts more efficiently than when given by rectal injection, and is less disagreeable to the patient. See **CANCER**.

SVENDSEN, JOHAN SEVERIN. A Swedish composer, died June 14, 1911. He was born in Christiania in 1849. His father was a famous bandmaster, and taught his son to play the violin. The boy wrote his first composition for that instrument when he was eleven years old. Three years later he entered the army and rose to be bandmaster. After serving six years he resigned and joined a wandering orchestra. As a member of this organization he happened to be in Lübeck, where the Norwegian consul obtained for him the aid of Charles XV. of Sweden. The young violinist was enabled to enter the Leipzig Conservatory, but was soon afterwards obliged to give up violin playing on account of paralysis of the hand. He remained in the conservatory to study the theory of music and composition. While there he wrote a quartette in A and several other instrumental pieces. In 1867 he received the honorary medal of the conservatory. In the following year he joined Musard's orchestra and arranged the incidental music for Coppée's *Le Passant*, in which both Sarah Bernhardt and Agar appeared. He left Paris to conduct the Euterpe concerts in Leipzig in 1870, but the Franco-German War prevented the concerts. His octette was played at a festival in Weimar in the same year and won great success. With the production of his symphony in D at the Gewandhaus in 1872 his fame as a composer was established. In 1871 he came to America, where he was married to an American woman; he then returned to Leipzig. He met Wagner at Bayreuth and became his intimate associate. From 1872 to 1877 he was

conductor of the Christiania Musical Association. In 1874 the Storthing granted him an annuity, and the king gave him several decorations. In 1883 he was made court conductor at Copenhagen.

SWANSON, CLAUDE AUGUSTUS. United States senator (Democrat) from Virginia. He was born at Swansonville, Va., in 1862, and was educated at the public school, at the Virginia Polytechnic Institute, and at Randolph Macon College, from which he graduated in 1885. He studied law at the University of Virginia and took his degree in 1886. From that time he practiced law at Chatham, Va., from which he was elected to the Fifty-third Congress. He was reelected to succeeding congresses until the Fifty-ninth. In 1905 he was elected governor of Virginia. He resigned his seat in Congress and served as governor until February 1, 1910. On August 1 of the same year he was appointed by Governor Mann to fill the vacancy in the United States Senate caused by the death of Senator Daniel, for the remainder of his unexpired term. He was reappointed by the governor from March 4, 1911, until the meeting of the General Assembly of the State. On September 7, 1911, he was elected Democratic nominee in the primary to fill the unexpired term beginning March 4, 1911. His term of office expires in 1917.

SWARTHMORE COLLEGE. An institution of higher learning at Swarthmore, Pa., founded in 1869. There were enrolled in the various departments of the college in 1910-11 395 students. The faculty numbered 46. There were no notable changes in the faculty during the year. The most noteworthy benefaction was a memorial gift in memory of Phoebe Anna Thorne. The productive funds of the college amount to \$1,233,008 and the income to about \$187,000. The library contains about 35,000 volumes. The president is Joseph Swain, M. S., LL. D.

SWAMP LANDS. See DRAINAGE.

SWAZILAND. A British protectorate covering an area in the southern part of Africa of 6630 sq. miles and with an estimated population (1911) of 90,000. The Swazi are a section of the Zulu race, and the native ruler is Lobatsebeni, queen regent and grandmother of the paramount chief Sobhuza, a boy of about fifteen. A resident-commissioner (in 1911 R. T. Coryndon) administers the country. By the South Africa act of 1909 it is provided that no land forming part of the native reserve shall be alienated. Imports (1910), £44,309; exports, £90,348; (raw gold, £44,499; tin ore, £41,768). Revenue (1910), £54,718; expenditure, £54,217. Debt, £90,000.

SWEDEN. A constitutional monarchy of northern Europe. The capital is Stockholm.

AREA AND POPULATION. The total area is 172,877 sq. miles; population 1900, 5,136,441; census of December 31, 1910, 5,521,943. Population per sq. kilometer, 12. Marriages (1909), 32,531; births, 142,987; deaths, 78,020; stillbirths (included in foregoing), 3482; emigrants, 21,992; immigrants, 9071. Population of Stockholm (December 31, 1910), 341,986; Göteborg, 167,813; Malmö, 88,158; Norrköping, 46,416; Helsingborg, 33,348; Gäfne, 35,302; Örebro, 30,098; Upsala, 25,960; Karlstad, 17,191; Kristianstad, 11,569; Södertälje, 11,060.

EDUCATION. Elementary schools (1908), 14,539, with 20,506 teachers and 780,248 pupils;

expenditure, 39,263,752 kronor. Public high schools (1909), 77, with 22,064 pupils; 15 elementary normal schools, with 1555; 9 technical schools, with 3700. There are special schools and universities at Upsala and Lund. Elementary instruction is free and compulsory, and illiteracy is rare. The national religion is the Lutheran; liberty of worship is granted to all sects.

PRODUCTION. About one-twelfth of the surface is under lakes. Over half the area is forest, and the products are a valuable export. The area in hectares for 1909 and the yield of principal crops for three successive years are shown below:

	Ha. 1909	1909	Yield in quintals 1910	1911
Wheat	93,000	1,881,000	2,047,619	2,241,070
Rye	404,000	6,338,000	6,237,350	6,270,240
Barley	193,000	3,037,000	3,385,320	3,199,720
Oats	807,000	11,728,000	12,876,680	11,025,770
Potatoes ...	153,000	15,696,000

Livestock (1908): 574,872 horses, 2,685,020 cattle, 1,010,217 sheep, 894,870 swine.

The mining and furnace products in 1909 were 3,886,000 tons of iron ore, 444,764 of pig iron, 308,823 of bar iron; silver and lead ore, 1721 tons; copper ore, 9562; zinc ore, 43,760; manganese ore, 5212; sulphur pyrites, 16,104; coal, 246,808. Gold produced, 14,083 kilograms; silver, 511.5; lead, 165,588; copper, 2,374,657; zinc, 634,872. Persons engaged in mining (1909), 29,157.

Saw and planing mills (1908), 1222, with 36,940 employees, output valued at 140,253,640 kronor; 522 joinery and furniture factories, 11,138 employees, 25,321,044 kronor; 157 wood-pulp factories, 12,362 employees, 79,578,910 kronor; 71 paper and pasteboard mills, 7389 employees, 47,364,416 kronor. Other industrial establishments are flour and sugar mills, machine shops, breweries, distilleries, and cotton and woolen mills.

COMMERCE AND COMMUNICATIONS. The trade for three years is shown below in kronor:

	1907	1908	1909
Imports	682,104,613	608,932,000	616,306,000
Exports ...	524,662,547	482,017,000	472,980,000

The principal articles of trade in 1909, with values, in thousands of kronor, were as follows:

Imports	1000 kr.	Exports	1000 kr.
Coal	55,966	Wood	134,682
Cereals	57,176	Wood pulp	57,358
Machinery	24,242	Iron	39,146
Petroleum	21,713	Butter	38,047
Coffee	33,415	Iron ore	28,596
Cotton	18,177	Paper	27,412
Skins	24,844	Machinery	27,554
Iron mfrs.....	16,218	Iron mfrs	11,699
Fish	15,537	Stone	10,631
Oilcake	18,503	Matches	11,382
Wool	13,775	Fish	9,508
Iron	10,804	Wooden wares ..	9,165
Woolens	10,887	Skins	8,991
Vegetable oils...	15,512	Animals	4,248

The principal countries of origin and destination, with the value of their trade (special) in thousands of kronor are given at top of page 673.

	Imports		Exports	
	1908	1909	1908	1909
Germany	210,730	213,984	103,341	97,209
Great Britain	159,441	157,558	169,342	155,842
United States	60,280	47,968	9,718	15,981
Denmark	45,217	41,215	45,908	45,073
Russia (with Fin.)	26,915	39,976	23,120	24,730
Norway	21,745	21,883	24,571	24,438
France	18,592	23,454	36,791	35,862
Netherlands	15,078	15,900	14,783	13,526
Belgium	7,940	7,880	12,537	13,209
Spain	2,889	2,936	7,431	6,409

Vessels entered (1909), 33,258, of 10,096,000 tons (17,386, of 5,157,000 tons, Swedish); cleared, 33,072, of 10,147,000 tons (16,642, of 5,040,000 tons, Swedish). Merchant marine, January 1, 1910, 2900 vessels, of 775,902 tons (steamers 1211, of 583,303).

Railways in operation (end of 1910), 13,839 kilometers (state, 4422); state telegraph lines 10,273 kilometers (wires, 32,220), railway telegraph lines 10,468 (wires 27,695); number of offices, 2847; post offices, 3739. Telephone wires, 137,311 kilometers urban and 126,141 interurban.

ARMY. The army of Sweden was still in process of reorganization during 1911 in accordance with the scheme adopted in 1901. Personal service is required, but periods spent with the colors are very short, consisting of eight months for the infantry and one year with the cavalry and artillery. The obligation is for eight years in the first line of the bevaring, four years in the second, and eight in the landsturm. A proposal was made in 1911 to increase active service to eleven years, but this was rejected. On a peace footing there were about 28,000 men, of whom 22,000 were serving with the colors, while others served for brief periods, but were regularly enrolled so that the total strength was about 64,000. The artillery was armed with Krupp quick-firing guns, and a number of improvements were under way, including the organization of six howitzer batteries. Reforms were also being made in the medical service, and the engineering troops were to be augmented by balloon, searchlight, and wireless sections. The new organization tended to make the army somewhat homogeneous, as the country was divided into military districts and the divisional commanders were supreme over the troops in this direction, so that they could be held for personal responsibility. The war strength of the kingdom, including the landsturm, was estimated at about 450,000, but by the new scheme of organization this figure could be increased to 600,000.

NAVY. The strength in ships October 31, 1911, was: 12 coast-defense vessels, of 67,250 aggregate tons; 1 armored cruiser (4100); 5 torpedo gunboats (4000); 8 torpedo-boat destroyers; 52 torpedo boats (and 6 building); 3 submarines (and 3 building). A small battleship of 6800 tons is projected. Personnel, 7500 of all ranks.

FINANCE AND GOVERNMENT. The krona is the monetary unit, valued at 26.8 cents. Budget estimates of revenue and expenditure for 1910 balanced at 228,139,000 kronor; 1911, 227,911,000; 1912, 257,196,700. Estimated receipts from customs and excise in 1912, 109,000,000 kronor. The debt stood, January 1, 1911, at 537,428,444 kronor.

The executive authority rests in a king (in 1911, Gustaf V.); he is aided by an executive

council. The Riksdag is the legislative body. The ministry in 1911 was composed as follows: Minister of State, K. A. Staaff; of Foreign Affairs, Dr. J. J. A. (Count) Ehrensward; Justice, G. Sandström; War, Dr. D. K. Bergström; Marine, J. T. Larsson; Interior, P. A. V. Schotte; Finance, A. T. (Baron) Adelsward; Worship, Dr. F. Berg; Agriculture, P. A. Petersson; without portfolio, B. A. Petren, K. J. Stenström, C. F. W. von Hederstierna, K. H. von Sydow.

HISTORY

INTRODUCTION. The Conservative Lindman ministry came into power in the spring of 1906. Its conduct during the great strike of 1909 occasioned much criticism. The working classes were embittered by their failure and blamed the government for not having intervened. The Socialists in particular contrasted the course of the ministry with that of certain foreign governments, which did not hesitate to use their authority on behalf of the general interests to secure an equitable settlement of industrial disputes. The official committee of conciliation established at that time was vested with so little real power that it could accomplish nothing. The Right had thwarted any efforts to ascertain the grievances of the workmen and had introduced a plan for industrial conciliation that seemed too favorable to the employers. This was opposed by the representatives of labor, who submitted an alternative plan, which was in turn rejected by the employers. The democratic movement moreover was growing stronger, and the government did not yield to it with a good grace. The measure for electoral reform (May 26, 1909) had been carried against the will of the Conservative element. This law made the right to vote in the elections for the second chamber practically universal and, besides, established the system of proportional representation.

THE ELECTIONS. The new electoral law went into effect in the elections for the general councils in 1910, and in September, 1911, it was for the first time applied in an election for the second chamber. The number of electors was more than doubled, and this was almost exclusively to the advantage of the parties of the Left. The plan for proportional representation was readily understood by the voters and worked successfully. The result was a sweeping victory for the parties of the Left. Out of the 250 seats the Liberals secured 102, the Socialists 64 (about twice their former number), and the Right, 64. Under these altered conditions the Conservative ministry resigned and the formation of a new cabinet was entrusted to M. Karl Staaff, who had been premier in 1905, and who accepted the office on condition that new elections to the upper chamber be held before January 1. He was obliged to choose his colleagues from the Liberals; for the Socialists in Sweden, unlike their fellows in the south German states, repudiated revisionism and stood firmly for the orthodox doctrine. They refused to be represented in the ministry. The first important measure of the new cabinet was the dissolution of the upper chamber. This was for the purpose of strengthening the new government, since an early vote on the extended basis of the suffrage would tend to bring its membership more into conformity with that of the lower house, and thus

strengthen the parties of the Left. The elections for the upper house were concluded by the beginning of December. They resulted in great gains for the Liberals and Socialists and in corresponding losses for the Conservatives. The parties in the new house were distributed as follows: 87 Conservatives, 51 Liberals, and 12 Socialists. Early in July 40,000 men were locked out in the building trades, having refused, after fruitless negotiations between them and their masters, to accept the compromise proposed by the latter.

SWIMMING. Charles M. Daniels of the New York A. C. again in 1911 proved himself supreme in the amateur swimming world, but there were indications that the throne he has been occupying so long is tottering. Other swimmers to achieve prominence during the year and who threaten soon to give Daniels a hard fight for first honors were Perry McGilivray and Hans J. Hebner of the Illinois A. C., Richard E. Frizelle of the Missouri A. C., J. H. Reilly and N. F. Nerich of the New York A. C., and R. M. Ritter of the City A. C. All these swimmers made excellent showings in 1911.

The championships of the Amateur Athletic Union were held in several different cities at various times during the year. The winners of the principal events were: Indoor—50 yards, H. J. Hebner; 100, 220, and 500 yards, C. M. Daniels; fancy diving, F. Bornemann. Outdoor—400 yards, R. M. Ritter (5 minutes, 52% seconds, new record); 880 yards, L. B. Goodwin; 1 mile, J. H. Reilly (25 minutes, 40% seconds, new record); high diving, G. W. Gaidzik.

Yale won the intercollegiate indoor championship, with Pennsylvania a close second. W. F. Howe of Yale captured the 50-yard and 100-yard events, F. R. Cross of Princeton the 220 yards, J. Willis of Pennsylvania the plunge for distance, and J. C. Stoddard of Yale the fancy

diving. Yale also won the water polo title. In the outdoor events Princeton carried off the laurels.

In the English championships H. Hardwick of Sydney made the best showing by capturing the 100 yards and 220 yards indoor and the 400 yards outdoor. R. M. Ritter of New York won the 50-yard and 220-yard events in the Canadian championships.

SWISS UNIVERSITIES. See UNIVERSITIES AND COLLEGES.

SWITZERLAND. A federal republic, consisting of twenty-five cantons (or, counting the two Unterwalds, the two Basels, and the two Appenzells as one each, twenty-two). Capital, Bern.

AREA AND POPULATION. The twenty-five cantons are given in the table below, with total area of each in sq. kilometers, area under lakes (sq. kil.), population according to the census of Dec. 1, 1911, density per sq. kil., population according to creed (Protestant or Catholic), and according to language (French, German, or Italian). Figures for creed and language are provisional and subject to slight revision. The total sq. kilometers are equivalent to 15,955 sq. miles.

Population in actual residence at time of census taking 1910, 3,765,123; 1900, 3,325,023; 1880, 2,846,102; 1850, 2,392,740. Total Jews in the Federation in 1910, 19,023; 1880, 7373; 1850, 3145. Total speaking Romansch as their mother tongue 1910, 39,834, of whom 37,147 in Graubünden (total 1880, 38,705).

Marriages (1910), 27,344; births, 96,669; deaths, 59,678; emigrants, 5178 (4256 to North America).

Bern had (December 1, 1910), 85,651 inhabitants; Zurich, 190,733; Basel, 132,276; Geneva, 123,154; Lausanne, 64,446; St. Gall, 60,177; Lucerne, 39,339; Neuchâtel, 23,741; Fri-

EDUCATION. Education is controlled by cantonal and communal authorities. Primary instruction is free and compulsory. Illiteracy in the Protestant cantons is rare; but in the Roman Catholic school attendance is not strictly enforced. The following table shows the number of schools and students enrolled in 1909:

Schools	No.	Students
Kindergarten	1,135	50,243
Primary	4,135	529,590
Secondary	642	54,474
Continuation	3,454	100,953
Polytech. and high	8	18,835
Intermed. and indus.	248	27,071
General	303	13,390
Reform	68	2,883
Deaf and dumb	18	813
For weak minded	27	979
For orphans	35	636
For epileptics	1	45
Missionary	3	189
Music	8	3,500
Total	10,085	803,600

Switzerland possessed in 1910, besides the Federal Politechnikum in Zurich, seven universities (Zurich, Bern, Basel, Geneva, Fribourg, Lausanne, and Neuchâtel), with more than 10,000 students and occasional attendants.

Religious toleration is denied to Jesuits alone.

PRODUCTION. Number of persons above the age of 14 engaged in agriculture (1905), 763,915. Of the total productive area, 866,500 hectares are under meadows, 687,540 under pasture, 244,731 under crops, 10,449 under gardens, 24,866 under vines, 200,934 under worked forest, and 53,429 under sedges.

The area and yield of principal crops are shown below for two years (1911 preliminary), with yield per hectare in 1910:

	Hectares		Quintals		Qs. per ha.
	1910	1911	1910	1911	
Wheat	42,400	42,365	750,000	959,220	17.7

Barley	5,200	5,181	86,000	98,800	16.5
Oats	32,600	32,644	630,000	704,000	19.3
Corn	1,300	1,330	30,000	30,800	23.1
Vines*	24,866	23,700	408,755	854,770	16.4

* Production in hectoliters.

Tobacco is cultivated in three cantons. The timber industry, pisciculture, salt mining, cement manufacture, and the manufacture of alcoholic liquors are leading industries. There are reported to be 2100 dairies, devoted largely to the supplying of the numerous chocolate, condensed milk, and cheese factories.

About 130,000 people are engaged in house industries. The silk industry is increasing, the watch industry declining. Silk mills, 80, employing 14,000 looms and about 25,000 persons. Employed in the cotton industry, 30,000 persons; spinning mills, 63, with 1,496,689 spindles; weaving mills, 65, with 19,750 looms; thread mills, 23, with 69,564 spindles. About 75,000 persons are employed in the embroidery and allied industries. Number of factories of all sorts in 1910, 7820; horsepower, 515,859; employees, 1,793,166.

COMMERCE. The trade is given in francs (C. & B.=coin and bullion) at top of next column.

COMMUNICATIONS. Railways in operation January 1, 1910, 4975 kilometers (3091 miles). The Bodensee-Toggenburg Railway was opened for traffic October 1, 1910. The line is about 62 miles long, with termini at Romanshorn (Thurgau) and Rapperswil (St. Gall). It crosses the Sitter River over a bridge 1238 feet long and 330 feet high; goes through the Bruggwald tunnel, 5709 feet; through the Wasserfuh tunnel, 12,741 feet; and through the Rickenunnel, 28,390 feet. The northern approach to the Simplon tunnel made considerable progress during the year, involving as it did the great Lötschberg, the Bietschthal and other tunnels. The Lötschberg tunnel was holed through in March, and the other tunnels made notable progress. (See TUNNELS.) An important electric cable line up the Niesen, 6000 feet above Lake Thun, was being built with a gauge of 3 feet 4 inches, and a gradient at the rate of 68 per cent. Progress was also being made on the Eismeer-Jungfrau Jock section of the Jungfrau line, and with the electrification of the Mont Cenis tunnel. State telegraph lines (1910) 3615 kilometers, wires 26,021; number of offices, 2286; telephone lines, 20,913 kil.; wires, 338,219; post offices, 1953.

FINANCE. The monetary unit is the franc, worth 19.3 cents. The revenue and expenditure for three years are given below in francs:

	1908	1909	1910
Revenue	147,391,133	155,678,421	166,866,721
Expenditure	150,879,386	158,842,817	161,330,520

Revenue and expenditure (actual) for 1910 are given as follows in thousands of francs:

Revenue	1000 fr	Expenditure	1000 fr.
Customs	80,661	Posts & Rys.....	71,392

Total	166,867	Total	161,331

The public debt stood January 1, 1911, at 242,573,786 francs.

ARMY. During the year the reorganization of the army was in progress. The four army corps were to be supplanted by three army commands, and the eight divisions into which the army was formerly organized were to be replaced by six. Each division was to have three brigades of two regiments of infantry, and the mountain troops, comprising four brigades, will form the third brigade in four of the six divisions. The artillery for each division will consist of twelve field and two howitzer batteries, instead of six field batteries as previously. The field army was revived, and a different disposition of the Landwehr and Landstrum in the plan of mobilization was provided for, as well as the organization of various supply troops, with the aim of securing increased efficiency and mobility for the field army. The law providing for these reforms, which was voted December 15, 1910, by the Council of Estates on March 31 passed the National Council.

The effective strength of the Swiss national army on January 1, 1911, represented a substantial increase over the strength of January 1, 1910, as follows: The effective of the army of the first line, the Elite and Landwehr, was 211,567 men, of whom 142,054 were in the Elite, and 69,513 were in the Landwehr, as compared with 140,784 and 68,546 on January 1, 1910. The Landstrum in 1911 consisted of 52,909 infantry, 15,380 men in other arms and departments, as compared with 52,621 and 13,917 respectively in 1910. The number of men available for the complementary service was increased on January 1, to 206,705, so that the total strength available on mobilization, including the army of the first line, the Landwehr and the complementary service is 486,851. The army budget in 1911 was greater than in previous years, and amounted to 42,926,291 francs for military purposes, as compared with 41,144,777 francs voted in the previous year, or an increase of 1,781,514 francs.

In eight years the increase for military expenses in the annual budget has been 14,397,634 francs, or a mean of 1,799,704 francs.

After further experiments by the army technical committee of rearmament, which were fol-

lowed closely by the parliament committees, a change of service rifle was determined by the Council of Estates and on April 4, 1911, an appropriation of 15,710,000 francs to be covered by a loan was voted to effect the transformation after a delay of four and one-half years. It was reported that the projected change principally concerned the following points: The gun barrel was to be different, the new cartridge requiring for its complete discharge a chamber of smaller dimensions. The entire length of the barrel was to be of thicker metal with a different form of rifling. There were to be a few modifications in the butt and stock.

GOVERNMENT. The executive authority is vested in a federal council of seven members, presided over by a president who is elected for one year. The legislative body is the National Assembly, composed of two chambers. Excepting for restrictions imposed upon all the cantons by the federal constitution, each is sovereign within its boundaries. The president from January 1 to December 31, 1911, was Marc-Émile Ruchet. Dr. Louis Forrer, elected December 14, 1911, succeeded to the presidency January 1, 1912. Heads of departments in 1911 were: War, E. Müller; Justice, Dr. Hoffmann; Finance, R. Comtesse; Commerce, etc., Dr. A. Deucher; Posts and Railways, Dr. L. Forrer; Interior, J. A. Schobinger.

HISTORY. The returns of the decennial census taken in December, 1910, gave Switzerland a population of 3,765,123 in actual residence, an increase of 440,000 over the figures of 1900. This increase was especially marked in the cities, and it required a redistribution of election districts in six of the cantons. It also increased the number of deputies in the National Council, who thenceforth numbered 189. The question of proportional representation which for many years had agitated the country was submitted to popular vote on October 23, 1910, and was negatived by a vote of 262,066 against 238,928.

In spite of this check, however, the cause of electoral reform continued, on the whole, to advance in 1911. Saint Gall, one of the larger cantons, adopted it after a long contest by a vote of 29,998 against 28,506. This made the ninth canton to accept the system. In Zurich it was rejected by a slightly larger vote than the canton had given against it in the plebiscite of October, 1910. One canton, Lucerne, which had already declared for the system, carried it into effect in 1911. In general, the advocates of proportional representation were confident of its early adoption throughout the country. Plans for the insurance of workingmen against sickness and accidents had been under discussion in Parliament for several years. A law on this subject, which had been carefully framed to meet the desires of all concerned, was presented during the summer session. As to sickness insurance, the main feature was subvention of private insurance companies and mutual insurance societies, that already existed or might be formed in future, provided that they conformed to certain rules laid down in the measure. Sickness insurance was not arbitrary, although the cantons and communes had authority to make it so within their jurisdictions. The accident insurance provision required the employers to take out insurance in a private company or mutual insurance society, which was to be under the control

and supervision of the Federal Council. The insurance act passed the Council of Estates unanimously and the National Council, with only twelve dissenting votes. The referendum was demanded by 75,000 citizens, and the date February 4, 1912, appointed for the popular vote.

The elections for the National Council passed off quietly on October 29. According to the first returns it appeared that the composition of the council would not differ much so far as the parties were concerned from that of its predecessor. The 189 seats were divided as follows: 113 Radicals of the Government party, 38 Catholic Conservatives, 15 Socialists, 14 Liberals of the Centre, 5 Democrats, and 4 belonging to no party.

SWORDS, EDWARD JENNER. An American railroad official, died August 3, 1911. He was born in New York City in 1842, and was educated in the schools of that city. In the Civil War he served as engineer in the volunteer service of the United States navy, and in that capacity performed an exploit of remarkable heroism. During the bombardment of Fort Fisher, December 24, 1864, the ship to which he was attached was struck below the water line by a ten-inch shell. This made a large aperture, and Swords and another volunteer offered to close it. In the face of a hot fire from the fort, he took a six-inch plug and, lowering himself into the water underneath the vessel, drove this into the hole with a sledge-hammer. As a result of this exploit, the ship was saved and was prepared to take part in the action on the following day.

TARIFF. The question of the tariff filled the largest place in the political history of the United States during the year 1911. It was, however, more from its political than from its economic standpoint that it derived its importance. Criticism of the Payne-Aldrich bill was not so pronounced as in 1910, but certain schedules in that bill continued to receive the denunciations of Democrats and Progressive Republicans and received a milder criticism from President Taft, who repeated his assertions, made directly following the passage of the bill, that the wool schedule should be revised and that it was in some aspects indefensible.

The presence of a Democratic majority in the House of Representatives for the first time in many years made it possible for the leaders of that party to enter upon an extensive effort to revise the tariff in accordance with Democratic theories. The very small majority of Republicans in the Senate, with the uncertainty as to the attitude of the Progressive Republican senators toward the policy of the administration on the tariff gave a fair degree of confidence that the bills which passed in the House would also pass in the Senate by a coalition of Democrats and Progressive Republicans. This assumption proved to be true.

The Canadian reciprocity agreement was, in a measure, divorced from party politics. The Democrats were committed to the general prin-

ciple of reciprocity, as it implied a reduction of duties, and the Republican party has been for years, at least theoretically, in favor of reciprocity with foreign countries. The measures directly pertaining to tariff legislation were the so-called Farmers' Free List bill, the Wool bill, and the Cotton bill. In addition to the events connected with the passage of these bills, was the offer of the President to have the tariff board made a permanent organization. These matters will be discussed below.

CANADIAN RECIPROCITY. The possibility of reciprocity between the United States and Canada was suggested to the Dominion Minister of Finance, Mr. Fielding, by President Taft in March, 1910. The suggestion was favorably received and the President met the Canadian minister at Albany, N. Y., and conferred with him in regard to the adoption of a maximum and minimum treaty under the new tariff law. The President in this conference expressed a desire that the negotiations between the United States and Canada might be carried farther than the mere adjustment of a maximum and minimum agreement, and consider, in addition, the feasibility of reciprocity. To this the Canadian minister made a favorable response. Formal negotiations were undertaken in the autumn of 1910, and after several postponements a conference between the negotiators of the two governments was formally reached on January 26, 1911. The following day the President sent the agreement to Congress with a special message, urging the enactment of the necessary legislation.

The agreement was presented concurrently to the Dominion Parliament at Ottawa. Taken generally, the reciprocity agreement opened the markets of the United States to the leading agricultural products of Canada, notably wheat and other grain, and also to her dairy products, eggs and poultry, fish, sheep, cattle, and other live animals. Rough lumber was also admitted by the agreement free of duty to the United States, as were print paper, wood pulp, and several other raw materials. In return for these concessions Canada agreed to admit free cottonseed oil, American fruits, and some other products, and grant reduced duties on agricultural implements and other manufactured articles. The total value of dutiable articles which the United States purposed to make free under the agreement was \$39,811,000, or 76.4 per cent. of the total dutiable exportations of Canada into the United States in the fiscal year 1910. The total value of articles previously dutiable which Canada purposed to make free amounted to \$21,658,000, or 16.5 per cent. of all the dutiable imports into Canada from the United States in 1910.

Opposition to the reciprocity agreement was strongest in New England and in the States of the Northwest bordering on Canada. In these States the chief opposition was against the admission of Canadian wheat and grain free. The provisions relating to the admission of paper and wood pulp were those to which the most aggressive opposition developed in Congress. By special agreement these provisions were not dependent on the acceptance by Canada of the reciprocity agreement. These provided that if Canada accepted the agreement, wood pulp of all kinds, news print paper and other paper and board to the value of four cents per pound should be admitted into the United States free

of duty, but only such pulp and paper should be admitted free upon which there were no export restrictions. Consequently their entry was confined to pulp and paper made from wood cut on private lands, as the Provinces of Ontario and Quebec refused to allow wood cut on crown lands to be exported in the raw state. An attempt was made in the Senate to amend the bill so as to make the free admission of Canadian pulp and paper contingent upon the ratification of the agreement by Canada. This amendment was offered by Senator Root, who claimed that under the terms of the reciprocity agreement Canadian pulp and paper would be admitted without duty even if Canada should reject the agreement, and that the act would discriminate against other countries with whom tariff trade agreements containing a "most favored nation" provision had been made. This amendment was defeated on June 26. The provisions relating to paper and wood pulp had the active support of the newspapers, as their passage would provide for cheaper paper used in printing. On February 14 the reciprocity measure was passed by the House by a vote of 221 to 93. The Senate, however, failed to concur in this action, and on the adjournment of the Sixty-first Congress the President summoned a special session to act on the reciprocity agreement (see CONGRESS).

The first vote on the bill in the special session was taken in the House on April 22, when it was again passed by an increased majority of 267 to 89. The Senate postponed action for two months, but finally passed the measure by a vote of 53 to 27. Voting for the bill were 18 regular Republicans, 3 insurgent Republicans and 32 Democrats; against it were 12 insurgent and 12 regular Republicans and 3 Democrats. The agreement was at once signed by the President. The work of the Canadian and American commissioners, Congress, and the President was rendered null and void by the defeat of the reciprocity agreement by the Canadian electorate, except as to the provisions for the admission of wood pulp, which went into effect on the passage of the measure. See CANADA.

FARMERS' FREE LIST BILL. This was the first of the bills to revise the tariff introduced by Representative Underwood, chairman of the ways and means committee. It was introduced into the House on April 19. In this bill all agricultural implements were declared to be free. Another clause provided for the admission of barbed wire fencing free and of wire and other material which could be used for fencing, including wire rods and wire rope. The bill also placed boots and shoes of all kinds on the free list. Leather, however, was not placed on the list. There were two clauses affecting meat and flour. As submitted in the House these placed meat and flour on the free list. In the Senate an amendment was placed on the provision limiting the operation of these two clauses to imports from those countries with which the United States had a reciprocal relation. This limitation made Canada the only country which would be affected by the provisions of the clauses. This bill passed the House on May 8 by a vote of 236 to 109. All the Democrats, 24 Republicans, and 1 Socialist in the House voted for it. In the Senate it was at first defeated by a tie vote, but after amendments had been made, it was passed on August 1, by a vote of 48 to 30. All

the Democrats, and 12 Republicans, chiefly Progressives, voted for it. As it contained amendments, the bill went to conference and the measure as reported was passed on August 17. On August 18 the President vetoed the measure. His reasons for this action were, first, that he had no adequate information upon it to pass an opinion as to the merits of the measure. He declared that revision should not be attempted until a report upon the articles affected had been made by the tariff board. He said the bill was so loosely drawn as to involve the government in endless litigation and to leave the commercial community in disastrous doubt. The measure was not passed over the President's veto.

THE WOOL BILL. Schedule K, relating to wool, was that portion of the Payne-Aldrich bill which met with the most hostile criticism at the time of the passage of that bill. Even the advocates of higher protection were unable to defend it, and the President declared that it was indefensible. It was well known that efforts would be made by the Democrats in the House to amend this bill. On June 6 Mr. Underwood submitted a bill for the revision of Schedule K. This bill reduced the ad valorem duty on raw wool from about 48 to 20 per cent. and made corresponding reductions in the duties on woolens. After a short debate the House passed the bill on June 20 by a vote of 221 to 100. In the Senate a substitute bill was offered by Senator La Follette. This measure fixed the duty on raw wool at 35 per cent. The committee on finance in the Senate reported this bill adversely, but on July 27 a coalition of Democrats and Progressive Republicans passed it by a vote of 48 to 32. Senator La Follette and Mr. Underwood then took up the two measures passed by the Senate and House, in conference, and arrived at a compromise by which the tax on raw wool first class was made 35 per cent., second class 10 per cent., and the average duty on woolens 55 per cent. This bill, against the vote of nearly all the regular Republicans and some of the insurgent Republicans, passed the Senate on August 15 by a vote of 38 to 28. On the previous day it had passed the House by a vote of 206 to 90. The President on August 17 vetoed the bill.

In his veto message the President stated his reasons, in the main, on the following grounds: He declared that he had been elected President on a platform which declared for a protective tariff and which fixed the proper measure of protection at "the difference between the cost of production at home and abroad." The Payne Tariff bill was passed as a result of his action in calling an extra session of Congress. That bill contained certain rates of duty which, in the opinion of many, were excessive. Granting the truth of this criticism, there were no means available by which it would be impartially determined what was the actual difference in the cost of production between the products of the United States and the same products abroad. A widespread conviction arose that such information must be secured before the tariff could be properly revised. For this reason and to prevent the evils of log-rolling and compromise, it was necessary to reduce the tariff schedule by schedule. It was further necessary to establish a permanent tariff commission that these exact facts might be obtained. Although the effort to establish this commission was defeated, a

ariff board was appointed by the provisions of the Payne law, and by added appropriations the President was enabled to use this board to do substantially the work that the commission was intended to accomplish. In order to secure authoritative data for the revision of the wool schedule, Congress called upon this board to undertake an examination into the woolen industry and furnished a report by December 1, 1911. Upon such a report the tariff board has been engaged, and if the passage of a bill to amend Schedule K, the woolen schedule, is postponed until December 1, Congress will then be in possession of a full and satisfactory report upon the whole schedule, which is the most complicated schedule in the tariff. It is apparent that many rates in the present schedule are too high, but there are no sufficient data upon which it can be determined how much they should be reduced in order to furnish a proper measure of protection and no more. The wool bill as finally passed is a compromise between an avowed tariff for revenue and anti-protection bill passed by the House, and a previous protection bill passed by the Senate. The industrial welfare of the country would be endangered by the revision of the wool schedule without exact data as to the extent to which it should be revised. The President has a double duty, to guard the industries of the country to the extent of giving them the benefit of a living measure of protection and to recommend a reduction of excessive duties to this level. In concluding his message the President said: "There is no public exigency requiring the revision of Schedule K in August without adequate information rather than in December next with such information. December was the time fixed by both parties in the last Congress for the submission of adequate information upon Schedule K, with a view to its amendment. Certainly the public weal is better preserved by delaying ninety days in order to do justice and make such a reduction as shall be proper, than now blindly to enact a law which may seriously injure the industries involved and the business of the country in general." An attempt to pass the measure over the President's veto in the House failed of the necessary two-thirds vote by a margin of 14.

THE COTTON BILL. The third of the tariff measures introduced by Mr. Underwood was brought into the House on July 26. The bill was avowedly a free trade bill and it made large reductions in the cotton duties. The bill passed the House on August 3 by a vote of 202 to 91. All the Democrats and 30 Progressive Republicans voted for it. In the Senate a substitute bill was introduced by Senator La Follette. This made somewhat smaller reduction in the duties on cotton. This bill was supported by the Progressives. During the discussion of this bill in the Senate the regular Republican senators absented themselves or refrained from voting so that the Democrats were left in full control of the Senate and were able to pass all the amendments which they wished made to the bill. This included amendments reducing the iron and steel schedule, making a horizontal reduction of 25 per cent. in the chemical schedule and reducing to 30 per cent. the duty on machinery used in cotton manufacture. With these amendments the bill passed the Senate on August 17 by a vote of 29 to 24. It was accepted by the House and was sent to

the President. He promptly vetoed it. In his message vetoing the bill he declared that the bill had been so hastily thrown together, and so little attention had been paid to the consideration of it in the Senate, especially in the chemical schedule, that the most ludicrous results had been reached. An examination of the bill by experts, he said, especially with respect to the chemical schedule, showed the greatest confusion. In a speech delivered later he declared the bill "impossible."

TARIFF BOARD. The efforts of President Taft to have a permanent tariff board or commission authorized by legislation were continued in the Sixty-first Congress. The board as it now exists has its being under a provision of the Payne-Aldrich act of 1909, which authorized the President to employ "such persons as may be required to secure information relating to the application of the maximum and minimum principle of the tariff, and for the administration of the tariff law." In 1910-11 Congress appropriated \$250,000 for the work of the board for the fiscal year. The President wished, however, a permanent board with larger powers, and early in January a bill was introduced into the House of Representatives providing for a permanent tariff commission of five members, not more than three of whom should be from any one political party. This commission should report directly to Congress as well as to the President, and its members should be appointed for terms of six years. The objects of the commission were to be an investigation of the comparative cost of production at home and abroad and also to study the condition of foreign trade and its effects on foreign tariffs and bounties. This bill was passed by the House on January 30 after a debate lasting nine hours. The Republicans were nearly united on the measure. Of the Democrats, 93 voted against the bill and 30 for it. The Democratic leaders voted in favor of the bill. The final vote was 186 to 93. In the Senate the bill passed on March 4, in spite of strong opposition led by Senator Bailey of Texas and several of the regular Republican senators. It was amended, however, and it was necessary to hold a conference between representatives of the House and the Senate before it could be finally passed. The reported bill was killed in the House by a Democratic filibuster. Congress had previously appropriated \$225,000 for carrying on the work of the board for the year 1911-12 and had requested that a report should be made on the wool schedule by December 1, 1911. The President early in March appointed two additional members to the board, thus making it a bipartisan board of five members. The new members were Thomas W. Page, professor of economics at the University of Virginia, and William M. Howard, former Congressman from Georgia, both Democrats. The board during 1911 presented a report on the pulp and news print paper industry, Schedule M of the Payne-Aldrich bill, and a report on the woolen schedule early in December.

The President based his vetoes of the tariff bills mentioned above mainly on the fact that the tariff board had not reported on the schedules and that there was therefore no trustworthy data for deciding on the merits of the reductions made. On September 28, at St. Louis, in an address in the Auditorium, he defended the work of the tariff board against certain

criticisms which had been made in Congress and elsewhere. He said:

"It has been said that the tariff board is a mere pretext, that it is a board of my hirelings and clerks, and that it is absurd for me to delay Congress in the enactment of that which is its highest privilege—to wit, revenue measures—until I can secure, through an agency of mine, information as to the wisdom of the proposed bills.

"The best way to understand the peculiar character of the investigations of the tariff board is to compare their published report on pulp and news print paper either with the statistical work of other government agencies regarding this industry or with the hearings before the ways and means committee. It is shown that this investigation does not in any way duplicate the statistical work of the other departments, but that its scope is quite different, and yet the investigation develops data essential to an understanding of industries from a point of view of the tariff."

The report of the tariff board on the wool schedule was awaited with the greatest interest. It was sent to Congress by the President with a special message on December 20. The report in general showed that the methods of assessing duty on raw wool were faulty in that they operated to exclude wools of high shrinkage in scouring, but fine quality, from the American market and thereby lessened the range of wools available to the domestic manufacturer; that the duty on scoured wool of 33 cents per pound is prohibitory and operates to exclude the importation of clean, low-priced foreign wools of inferior grades which are nevertheless valuable material for manufacturing and which cannot be imported in the grease because of their heavy shrinkage. Such wools, if imported, might be used to displace the cheap substitutes now in use. The report showed in detail the difficulties involved in attempting to state in categorical terms the cost in wool production and the differences in cost as between different regions and different types of wool. The findings of the board showed that in the woolen district the actual manufacturing cost, aside from the question of the price of materials, is much higher in the United States than abroad; that in the making of yarn and cloth the domestic woolen or worsted manufacturer has in general no advantage in the form of superior machinery or more efficient labor to offset the high wages paid in the United States. The report of the board was exhaustive and went into every detail of the raising of sheep and of the manufacture of wools of all variety. There was no recommendation as to proposed rates of duty, as this is no part of the functions of the tariff board. The President in his message accompanying the report said: "The findings of fact by the board show ample reason for the revision downward of Schedule K in accord with the protective principle and present the data as to relative cost and prices from which it may be determined what rates will fairly equalize the difference in production cost. I recommend that such a revision be proceeded with at once." (See WOOL.) Following its report on the wool schedule, it was announced that the next work of the board would be the examination of the cotton schedule. The board in 1911 was composed of the following members: Henry C. Emery, chairman, Alvin H. Sanders, James B.

Reynolds, William M. Howard, and Thomas W. Page.

TASCHEREAU, Sir HENRI ELZÉAR. A Canadian jurist, died April 14, 1911. He was born in 1836. After studying law he was admitted to the Quebec bar in 1857 and became a queen's counsel in 1867. From 1861 to 1867 he sat in the Canadian legislative assembly. He was appointed a judge of the Quebec Superior Court in 1871 and a judge of the Supreme Court of Canada in 1878. From 1902 to 1906 he was chief justice. He was created a knight in 1902 and a member of the privy council in 1904. He was the author of several law treatises.

TASMANIA. An island state of the Commonwealth of Australia. The area is stated at 26,215 sq. miles. Final return of the census of April 3, 1911, showed a population of 191,211, as compared with 172,475 in 1901; the increase in the decade was 10.86 per cent., as compared with 18.05 for the Commonwealth. The capital is Hobart, with 38,055 inhabitants in 1911 (preliminary returns). The executive authority is vested in a governor, who is appointed by the British crown, and is assisted by a responsible ministry. The legislative power devolves upon a parliament of two elective houses. Governor in 1911, Maj.-Gen. Sir Harry Barron; premier, (from June 19, 1909), Sir Elliott Lewis. See AUSTRALIA.

TAXATION. THE CORPORATION TAX. A number of the cases involving the constitutionality of those sections of the Payne-Aldrich Tariff law imposing a tax on corporations were decided by the Supreme Court on March 13, 1911. The court upheld the constitutionality of those provisions, the contentions of the government being sustained on practically every point. One of the arguments against constitutionality was that this tax is an excise tax on the privilege of doing business in the corporate form; since this privilege is derived from the States the national government cannot tax it without invading the rights of the States. In connection with this it was argued that the corporation is an instrumentality of the State, and, therefore, under the traditions of judicial interpretation cannot be taxed by the national government. The Supreme Court held that the exemption of the instrumentalities of the States from federal taxation "has never been extended to the exclusion of the activities of a merely private business from the federal taxing power, although the power to exercise them is derived from an act of incorporation by one of the States. We, therefore, reach the conclusion that the mere fact that the business taxed is done in pursuance of authority granted by a State in the creation of private corporations does not exempt it from the exercise of federal authority to levy excise taxes upon such privileges." Another argument against the tax was that it was a direct tax and therefore must be apportioned among the States according to population. The court upheld the view that it is not a direct tax, but an excise tax on the privilege of conducting business under the corporate form: it need not, therefore, be apportioned. It was argued that the tax was objectionable since it singled out for taxation those corporations and joint stock companies doing a business for profit and did not apply to all corporations. The court held that the constitution did not require such uniformity: the law does tax uniformly corporations of the same class. It was objected

that some corporations derive a portion of their income from property, such as public bonds, which are non-taxable. The court held that this argument confuses the measure of the tax upon a privilege, with direct taxation of the state or thing taxed." The court has previously held that where a tax lawfully applies to a privilege the measure of such tax may be the income from the property of the corporation, although a part of such income is derived from property in itself non-taxable."

NATIONAL INHERITANCE TAX. Although the national inheritance tax law enacted during the Spanish-American War was repealed long since, the case of the United States v. The Fidelity Trust Company growing out of that law was only decided in 1911. This decision, therefore, is primarily of theoretical interest, although it reverted the return of some \$2,000,000 collected under the inheritance tax law, and would have considerable practical significance if the government should again enact a similar law. It involved the taxation of an annuity or deferred claim under the inheritance tax law. An inheritance left in the hands of trustees was to be paid to the inheritor quarterly through life. The value of the property left in trust was 20,000 and the internal revenue department sought to collect taxation upon a capitalized sum of \$74,678, this being fixed upon by the use of mortality tables and a 4 per cent. interest rate as the present value of the inheritance. Opposition was made on the ground that the inheritance was received only as the quarterly sums were actually paid and that it could not be taxed until paid. The lower courts, including the Court of Claims, decided against the government on the ground that this case did not differ essentially from several cases in which it had been decided that an annuity which was not invested in any special funds, such as annuities as those paid by life insurance companies, was taxable only as paid. The Supreme court reversed these decisions on the ground that the interest acquired by the inheritor "was of a contingent right to income as it should accrue, but was a vested life estate in a fund hanging in investment at the discretion of the trustee, but retaining its equitable identity."

NEW YORK. Among the more important laws of the year were certain changes made by the New York legislature with reference to the taxation of real estate, of personal property, and of inheritances. Beginning with 1912 taxes on real estate will be paid semi-annually in May and November. This change is expected to be of advantage to the poorer property holders who find it inconvenient to pay the year's taxes in one sum. It will also be of great advantage to the city by distributing its income over two periods instead of one. The city will thus not be obliged to borrow as much or as frequently as in the past. What is known as the "secured debt" law enacted in 1911, relieves from taxation bonds and other solemn obligations for the payment of money other than debts secured by mortgages on New York real estate. This relief is secured by registering the secured debt with the State comptroller by the payment of one-half of 1 per cent. of its face value. This law is in fact an extension of the mortgage recording tax law which relieved from taxation debts secured by mortgages on New York real estate. During the month of September, the first month for registration, about \$150,000,000

of bonds were registered by the State comptroller. Another change of equal importance was the reduction in the rates of inheritance taxation. The general tendency in the taxation of inheritance is toward a progressive rate. This was carried out by the New York law of 1910 in an extreme form, the maximum rate being 25 per cent. The result was that capital and securities were being driven from the State rapidly. The new law makes no attempt to tax non-residents, except on real estate or tangible property actually located within the State. Neither stocks, bonds and other securities of non-residents on deposit in New York, nor the investments of non-residents in New York corporations will be subject to the new inheritance tax. The rates reach a maximum of 4 per cent. on direct, and 8 per cent. on collateral inheritances in excess to \$1,000,000 to any one person. More liberal exemptions were allowed also than heretofore.

WISCONSIN. The Wisconsin legislature passed a progressive income tax measure. Such a measure had been advocated by tax reformers in the State for ten years, and in recent years the platforms of both political parties have recommended its passage. This, however, was done against the opposition of the conservative members of both parties; the final passage of the law was accomplished by the fusion of the more progressive members, including those who believed in income taxation as a general means of social reform, and those who favored it as a substitute for the personal property tax. The latter feature of the new law is conspicuous, all personalty being exempted, except farm animals and merchants' and manufacturers' stocks. In addition the law contains a provision whereby receipts for taxes on personal property may be used to pay taxes on incomes. The new law applies to individuals and to business concerns, the taxation of the latter making possible a considerable application of the principal of "stoppage at source." Business concerns will be assessed as business units. Those doing interstate business will be taxed in proportion to the amount of their business and the amount of their property within the State. Corporations will report directly to the State tax commission, and will be assessed by the commission like public service corporations under the ad valorem system. Exceptions are as follows: For an individual, \$800; for husband and wife, \$1200; for each child under 18, and for each other dependent person, \$200. The rates are progressive, but different schedules are provided for corporations and for all others. For corporations the rates vary from .5 per cent. to 6 per cent., depending on the ratio of income to the assessed value of the property earning the income. Thus, where the income is less than 1 per cent. of the property, the rate is .5 per cent.; where the income is 12 per cent. or more on the property the income tax rate is 6 per cent. For all others the rates range from 1 per cent. on the first thousand dollars to 6 per cent. on all above the twelfth one thousand dollars. The administration of the tax is centralized and placed under civil service rules. There will be 40 income assessors besides deputies. In the distribution of the proceeds of the tax, however, the State will retain only 10 per cent., the counties will get 20 per cent., and the townships or cities, 70 per cent.

GERMANY. In recent years the taxation of the unearned increment in land values has become more and more common among German cities. This movement, which in some respects is based on theories of Henry George, is a natural expression of the highly developed community life of the German cities. The fundamental principles upon which it is based is that most of the increase in the value of land is due to the community and the state as a whole, rather than to the individual activity of the land owner. On February 1, 1911, the Reichstag passed the Increment Tax bill. This provided for a special tax on any increase in land values not due to the labor or expenditure of the property owner. The tax is progressive in form, the rate depending on the ratio of the increase in value to the purchase price. Thus, a tax of 10 per cent. is levied on an increment not exceeding 10 per cent. of the gross purchase price; and the rates are increased to 30 per cent. on increments exceeding 290 per cent. of the purchase price. Numerous exceptions and abatements are provided for.

TELEGRAPH EARNINGS. See **ELECTRICAL INDUSTRIES.**

TELEGRAPHY. The deferred message plan, which was inaugurated in the form of the night letter in 1910, underwent great development in 1911, especially in the introduction of the day letter at low rates and in the great reduction of trans-Atlantic cable rates for deferred messages. The Mercadier-Magunna system of multiplex telegraphy was given a very successful trial between Paris and Lyons. In this system the senders are tuning fork vibrators, each of which sends a current of different frequency. The receivers are vibrating metal disks acting as relays, each tuned for its particular frequency. Six printing telegraphs were so operated simultaneously with a quadruplex direct-current system, giving ten simultaneous messages per circuit.

TELEGRAPHY, WIRELESS. See **WIRELESS TELEGRAPHY AND TELEPHONY.**

TELEPATHY. See **PSYCHICAL RESEARCH.**

TELEPHONE EARNINGS. See **ELECTRICAL INDUSTRIES.**

TELEPHONY. The most notable advances in telephony during 1911 were in the field of long-distance transmission. A new type of Pupin coil for loading metallic circuits which are to be associated into phantom lines was brought forth, and it largely solves the problem of leakage and cross talk, which has so greatly retarded the phantom operation of long-distance lines. The two windings of the new type are so interleaved that no consequent poles are formed at the junctions and the capacity between the core and the casting has been greatly reduced. This step is believed to set forward the accomplishment of trans-continental telephony. The new Anglo-Belgian loaded cable was successfully equipped for phantom operation.

The construction of underground trunk lines from New York to Boston, and to Philadelphia, and from the latter city to Washington, was partially completed. These lines were laid in pump-log wooden conduits, which had been

heavily creosoted, a type which experience has shown to be extremely durable. Some 30,000 loading coils were installed on these lines, which aggregate 450 miles in length. A new type of cable, invented by Cuntz, is regarded as a very successful solution of the loading problem. It consists of a core of fine iron filaments with copper conductors applied helically. The inductance is thus uniformly distributed and may be adjusted to the exact extent necessary to neutralize the capacity of the conductors by altering the pitch of the conductors or the cross-section of the iron core.

During the year the use of the automatic system was extended to a moderate extent, the most notable increase being in Chicago. The union of the telephone and telegraph interests has promoted higher efficiency in both branches. Closer association of the Bell and independent companies in the interchange of toll and long-distance messages proved to be generally advantageous. In England the year was notable for the complete nationalization of the telephone system under the administration of the post office department.

The rapid encroachment of the telephone on the telegraph for train dispatching has continued until 25 per cent. of the total railway mileage of the country is so operated. The telephone is found to be quicker, more flexible, and fully as accurate.

TELEPHONY, WIRELESS. See **WIRELESS TELEGRAPHY AND TELEPHONY.**

TENNESSEE. POPULATION. The Thirteenth Census showed a population of 2,184,789, compared with 2,020,616 in 1900, an increase of 8.1 per cent. in the decade. The principal cities, with their populations in 1910 and 1909, are given below (the figures in parentheses are for 1900): Memphis, 131,105 (102,320); Nashville, 110,364 (80,865); Chattanooga, 44,604 (30,154); Knoxville, 36,346 (32,637); Jackson, 15,779 (14,511).

AGRICULTURE. The Thirteenth Census included statistics of agriculture. These are of date of April 15, 1910. On that date the farms in the State numbered 246,012, compared with 224,623 in 1900. The land in farms was 20,041,657 acres, compared with 20,342,058 in 1900. The improved land in farms was 10,890,484 acres, compared with 10,245,950 in 1900. The average acreage per farm in 1910 was 81.5, compared with 90.6 in 1900. The value of farm property, including land, buildings, and implements and machinery, domestic animals, poultry, and bees was \$612,520,836, compared with \$341,202,025 in 1900. The average value of all property per farm was \$2490 in 1910, compared with \$1519 in 1900. The average value of land per acre was \$18.53, compared with \$9.93 in 1900. The farms operated by owners and managers in 1910 numbered 144,931, and those operated by tenants, 101,061. Of the farms operated by persons owning all or part of the land, the farms free from mortgage numbered 118,285, and those under mortgage 24,006. The native white farmers numbered 206,821; foreign-born white, 883; negro and other non-white, 38,308. Of the non-white farmers all except 7 were Indians or negroes. The cattle and poultry of all kinds were valued at \$110,706,078, compared with \$60,818,605 in 1900. The cattle numbered 996,529, valued at \$20,690,718; horses and

colts, 349,709, valued at \$39,320,044; mules, 275,855, valued at \$35,100,810; swine, 1,387,938, valued at \$7,329,622; sheep, 795,033, valued at \$3,009,196. Poultry of all kinds numbered 8,056,145, valued at \$3,757,337. The acreage, production, and value of the principal crops in 1910 and 1911 are shown in the following table:

	Acreage	Prod., bu.	Value
Corn1911	3,400,000	91,120,000	\$55,583,000
.....1910	3,400,000	88,060,000	49,314,000
Wheat1911	720,000	8,280,000	7,949,000
.....1910	711,000	8,319,000	8,153,000
Oats1911	315,000	6,142,000	3,071,000
.....1910	342,000	7,866,000	3,618,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. The State is a large producer of copper. The output in 1910 was 16,691,777 pounds, a decrease from the production of 1909, which was 19,207,747 pounds. The decrease was due to the inability of the sulphuric acid plants to handle the fumes from the smelters when operated at full capacity. The entire output was from the Ducktown district, in the extreme southeastern part of the State in Polk county. The output of copper in the State in 1911 showed a slight increase over the production of 1910. This increase was due to the enlargement of the acid plants connected with the smelters of the Ducktown district, which permitted the smelting of more ore. The production of sulphuric acid is now an important factor in the smelting industry of this district. The total production of coal in the State in 1910 was 7,121,380 short tons, valued at \$7,925,350, an increase of 12 per cent. over the production of 1909, when the output amounted to 6,358,645 short tons, valued at \$6,920,564. This production was the largest in the history of the State. The mines were practically free from labor troubles in 1910. There were 11,930 men employed, and the average production for each man employed was 597 short tons for the year. There were killed in the coal mines of the State during the year, 38 men, and 210 were injured. The coal output in 1911 was estimated at the end of the year to be about 10 per cent. less than that of 1910. The iron ore mined in the State in 1910 amounted to 732,247 long tons, valued at \$1,048,323, as compared with 657,795 long tons, valued at \$997,282 in 1909. See IRON AND STEEL.

The State produces a small amount of gold and silver. The gold production in 1910 was 135 fine ounces, valued at \$2800. The silver production in the same year was 69,800 fine ounces, valued at \$37,700. The gold production in 1911 was 684 fine ounces, valued at \$14,140. The silver output was 126,683 fine ounces, valued at \$69,676.

EDUCATION. The school system of the State includes the State University, 4 normal schools, 3 for whites and 1 for colored, and city and town systems of schools, covering, in most instances, all grades from the primary through the high schools; county public high schools,

county elementary schools, and a large number of private institutions, including academies, seminaries, commercial schools, professional colleges, and universities. Special lines along which work was directed in 1911 included consolidation, with transportation, vitalized courses of study which will relate the school more directly with community life; more competent supervision of a general and special nature; plans for increased attendance, better teachers, more direct and vital participation on the part of the adult population and a more serious endeavor to make some immediate contribution to the life of the people.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions, and their populations in 1911, under the care of the State, are as follows: Tennessee Penitentiary, 1069; Bushy Mountain Branch Prison, 718; Central Hospital for the Insane, 651; Western Hospital for the Insane, 697; Eastern Hospital for the Insane, 544; Confederate Soliders' Home, 120; Tennessee School for the Blind, 218; Tennessee Deaf and Dumb School, 253; Tennessee Industrial School, 796.

POLITICS AND GOVERNMENT

The legislature met in January, 1911, and the most important measures enacted will be found noted in the paragraph *Legislation* below. The expiration of the term of Senator Frazier made it necessary for the legislature to choose his successor. The attempt to accomplish this brought about a deadlock which lasted for three weeks. This was largely due to the existence of factions in the Democratic party. The "regular" Democrats in the lower house refused to appear and take the oath of office, asserting that the fusionists intended to contest several seats. The fusionists, however, proceeded to organize the house, a majority of members being present. The upper house refused for a time to recognize the lower house as organized. After some days of absence the "regulars" returned to their places, and the business of the legislature proceeded, the organization already perfected being ratified. Senator Frazier was unable to secure a sufficient number of votes for reelection. Benton McMillin, a "regular" Democrat, was the leading candidate until the fourth ballot on January 23, when Luke Lea, independent Democrat, was elected, receiving the votes of fusionists and three regulars.

The refusal of the regular Democrats to take their seats and thus make a quorum delayed the formal seating of Benjamin W. Hooper, Republican, who was in 1910 elected governor of the State on a fusion ticket, being indorsed by the independent Democrats. The opposing candidate was Senator Robert L. Taylor. Mr. Hooper was the first Republican governor elected in Tennessee in 30 years. With him was elected as railroad commissioner, B. A. Enloe, independent Democrat. Governor Hooper was finally inaugurated January 25.

A curious situation developed in the legislature in April from an attempt to pass a bill amending the laws creating a State Board of Elections. The legislature of 1908, which was also controlled by a coalition of Republicans and independent Democrats, passed a bill which took from the governor the power to appoint three members of the State Board of Elections,

which had exclusive power of appointing commissioners of elections in each county. This power was formerly vested in the governor. The attempt was made to amend this law. This amendment consisted in increasing the number of the State board to nine, and giving to Democratic and Republican members representation. The fusionists fought the amendment, claiming it was a step toward the repeal of the prohibition laws. The bill passed the Senate and was sent to the House of Representatives. It was there amended by reducing the number of commissioners from nine to seven, and was finally passed by a majority of one, several Republicans joining the regular Democrats to pass the bill. It was sent back to the Senate and the amendment concurred in. The bill was then sent to Governor Hooper. The constitution requires that a bill passed by the Assembly and sent to the governor must be returned by that executive within five days to the house in which it originated, bearing his approval or disapproval, or it becomes a law without his signature. If he disapproves, the two houses again vote on the bill, and if it obtains a majority of the members of each house, it becomes a law. While the bill was still in Governor Hooper's hands, 35 members of the house, Republicans and independent Democrats, who did not wish the amendment to pass, left the capital and went to Alabama. Their purpose was to continue to remain out of the State until the "regulars" weakened or until the expiration of the session of the legislature and in the meantime have the governor veto the bill and leave the House without a quorum to pass it over the veto. The Senate passed the bill over the veto, but it was impossible to take any action in the House. The comptroller refused to honor warrants because of the failure to pass the appropriation bills, and the situation was becoming acute when, only a few days before the interest on the State's bonded debt was due, enough of the "regulars" weakened and agreed to vote to sustain the governor's veto, so that the fusionists returned to the State and the legislative session was finished.

In the last days of the session a contest arose over Governor Hooper's veto of a "salary grab" bill, giving each member \$500 extra pay. The amount was finally reduced to \$200, and the bill passed.

Toward the close of 1911 strong efforts were made to unite the two factions of the Democratic party.

OTHER EVENTS. Of most importance in an industrial way during 1911 was the development of water power on streams in eastern Tennessee. Three hydro-electric power plants are in construction, one on the Ocoee River at Parksville, developing 65,000 horsepower, one on the Tennessee, developing 60,000 horsepower, and one on the Watauga, developing 20,000 horsepower.

In December a coal dust explosion occurred in the Cross Mountain Mine at Briceville and 86 miners were killed.

LEGISLATION. The important measures enacted at the legislative session of 1911 include the following: Cities and municipalities are authorized to purchase property without the corporate limits, and to direct and equip a tuberculosis hospital. Some counties are given the same authority. A measure was passed

securing to a married working woman the right to receive payment for her own wages when she is dependant upon such wages for the support of herself or her children, providing she gives notice in writing to her employer. The Superior Appellate Courts of the State are forbidden to reverse any case tried or triable by jury in the lower courts, and to dismiss such cases upon the merits without giving parties an opportunity through their counsel to be heard by oral argument in such courts. Other amendments were made to the laws governing judicial procedure. The banking laws were amended. It is made a misdemeanor to sell, distribute, or have in possession spurious unauthorized rituals, or secret work of any secret or fraternal order in the State.

STATE OFFICERS. Governor, Benjamin W. Hooper, Republican; Secretary of State, H. W. Goodloe, Democrat; Treasurer, George T. Taylor, Republican; Commissioner of Agriculture, George Peck, Republican; Superintendent of Education, J. W. Brister, Democrat; Comptroller, Frank Dibrell, Democrat; Adjutant-General, Frank Maloney, Republican; Attorney-General, Charles T. Cates, Jr., Democrat; Commissioner of Insurance, George T. Taylor, Republican.

JUDICIARY. Supreme Court: Chief Justice, John K. Shields; Justices, A. S. Buchanan, Grafton Green, M. M. Neil, and D. L. Lansden; Clerk, Joe J. Roach—all Democrats.

STATE LEGISLATURE, 1911. Democrats, Senate, 25, House 74, joint ballot 99. Republicans, Senate 8, House 25, joint ballot 33. Democratic majority, Senate 17, House 49, joint ballot 66.

The representatives in Congress will be found in the article UNITED STATES, *Congress*.

TENNESSEE, UNIVERSITY OF. An institution of higher learning at Knoxville, Tenn., founded in 1794. The students in all departments of the university in 1910-11 numbered 1681. There were 157 members of the faculty. During the year P. P. Claxton, professor of education, resigned to become United States commissioner of education. Among the new appointments to the faculty were those of Dr. E. E. Buchanan, professor of mathematics; Miss Caroline Carpenter, assistant professor of languages; Dr. E. E. Rall, professor of education; James C. Pridmore, assistant professor of agronomy, and Louise G. Turner, assistant in home economics. Among the gifts received during the year was one of \$40,000 from Andrew Carnegie for the establishment of a Carnegie library. The productive funds of the university amounted to \$425,000, and the income for the year 1910-11 to \$237,764. The library contains about 35,000 volumes. The president of the university is Brown Ayres, Ph.D., LL.D.

TERMITES. See ENTOMOLOGY.

TERRY, GEORGE SETH. An American public official, died April 14, 1911. He was born in Hudson county, N. Y., and graduated from Williams College. He began his active career in a dry goods house in New York City. He became a member of the firm of William I. Peake & Co., which later became the firm of Opdyke, Terry & Steele. In the administration of Mayor Strong he served as secretary to the dock board and he occupied other positions in the city government. In 1904 he was assistant treasurer of the Republican national committee, and in 1909 he was appointed as-

assistant treasurer of the United States to succeed Hamilton Fish.

TERRY, SILAS WRIGHT. An admiral, retired, of the United States navy, died February 9, 1911. He was born at Wallonia, Ky., in 1842 and graduated from the United States Naval Academy in 1861. During the Civil War he served on the North Atlantic and the Mississippi blockading squadrons. He was advanced five numbers for gallant conduct on the naval expedition up the Red River. He held various commissions and took part in several notable expeditions. In January, 1882, while commanding the *Marion* he rescued the crew of the bark *Trinity*, which had been wrecked in October, 1880, on Heard Island, Indian Ocean. In February, 1881, while at Cape Town he guided the English ship *Poonah* off the beach, saving her from total loss, for which he received the thanks of the government of Cape Colony and of the English government. During the Spanish-American War he served on the battleship *Iowa*. His last active service was as commandant of the naval station at Honolulu. He was retired in 1904.

TESLA STEAM TURBINE. See STEAM TURBINES.

TETANUS AND THE FOURTH OF JULY. The ninth annual summary of the fourth of July injuries, compiled by the *Journal of the American Medical Association*, shows a still further decrease over the previous year in the number of tetanus cases occurring as a result of the celebration. There were only 18 cases of tetanus in 1911, as against 72 cases in 1910 and 150 cases in 1909. The number of blank cartridge wounds shows a correspondingly large decrease, viz., from 450 to 169. The most common cause of the wound is the blank cartridge, and the most common site is the hand. All but one of the 20 lockjaw patients were males, and all but 3 were under 18 years of age. The youngest was 4 years old, the oldest 40. The number of days following the injury before active symptoms appeared was 5 to 15, the average for fatal cases this year being about 8 days. A longer incubation period is thought to indicate a less virulent infection and therefore a better chance for recovery under treatment. When death occurred, it followed the appearance of symptoms in from 2 to 3 days. Blank cartridges continued to be responsible for the great majority of tetanus cases, 15 cases being due to this cause. Two cases of tetanus were due to injuries by firecrackers and one from a wound from a bomb. Ten of the 18 cases ended fatally. Besides the cases of lockjaw due directly to the use of fireworks, there were 29 cases of tetanus due to penetrating wounds from other causes, such as nails or splinters during the fourth of July season. In addition to the 10 deaths due to tetanus, 47 persons were killed in the United States by various forms of fireworks, making a total of 57 deaths. This is the lowest number from such causes during the nine years covered by the *Journal's* statistics, and shows a very decided improvement over previous years. Eleven people were killed outright by firearms, 9 by explosions of powder, bombs, or torpedoes, 5 by cannon, 2 by giant firecrackers, and 8 by various causes such as blood poisoning, explosions of chemicals, etc. The largest number of deaths due to any one cause was 12, mostly little girls, who were burned to death; in several

instances by the so-called harmless varieties of fireworks, including very small firecrackers and "sparklers."

There were 1546 non-fatal injuries—a little more than half of the total reported in 1910. Eight persons were totally blinded, 26 lost one eye each, 30 lost legs, arms, or hands, and 83 lost one or more fingers. The giant firecracker continued to hold first place as a cause of mutilating wounds, and is responsible for most of the losses of eyes, hands, and fingers. In 1911 483 injuries, including two deaths and two cases of lockjaw, were due to the giant firecracker. Firearms caused 184 accidents; 80 persons were injured by stray bullets; toy cannon caused 114 injuries, including 5 killed. In the nine years a total of 38,129 people, or the equivalent of over 39 regiments, were killed in the celebration of the fourth of July.

The remarkable decrease in the number of injuries in 1911 is believed to be due to the general agitation for a more sane observance of the holiday. An analysis of the statistics showed that the most marked decreases were in the States where the agitation for restrictive measures was strongest.

As to the curative treatment of tetanus, there was no decided step in advance, in this country. In the cases reported, tetanus antitoxin was employed in 7 instances, but always after the disease had begun. It is well known that this agent is very valuable as a prophylactic, but possesses comparatively little curative value. When employed after active symptoms of tetanus have manifested themselves, antitoxin must be given in large doses, and a review of the latest literature on the use of tetanus antitoxin seems to indicate that the best route is the intraspinal. Reports show a distinctly higher percentage of recoveries in which the antitoxin has been given in this way than when injected into the muscles. Baccelli reports using intraspinal injections of carbolic acid in weak solution in nearly 200 cases of tetanus. He lost no mild cases and saved many inflammatory cases. Of 121 severe cases all but 7 survived, representing a mortality of less than 6 per cent. in a type of disease usually highly fatal. The method has not been tried in this country.

TETLOW, JOHN. An American educator, died December 10, 1911. He was born in Providence, R. I., in 1843 and graduated from Brown University in 1864. From 1885 to 1907 he was headmaster of the Girls' High and Latin schools of Boston. In the latter year he was appointed headmaster of the Boston Girls' Latin School, and this position he held until the time of his death. He was one of the organizers of the New England Association of Colleges and Preparatory Schools and was its president in 1893. He was a member of several other associations for teachers in high and classical schools. He was president of the Headmasters' Association of the United States in 1904-5. He was the author of *Inductive Latin Lessons* in 1884, and published a series of school classics, 1893-1901. He contributed also to educational journals.

TEXAS. POPULATION. The Thirteenth Census showed a population in 1910 of 3,896,542, compared with 3,048,710 in 1900, an increase of 27.8 per cent. in the decade. The principal cities with their populations in 1910 and 1900 are given below (the figures in parenthesis are for 1900): San Antonio, 96,614

(53,321); Dallas, 92,104 (42,638); Houston, 78,800 (44,633); Ft. Worth, 73,312 (26,688); El Paso, 39,279 (15,906); Galveston, 36,981 (37,789); Waco, 26,425 (20,886); Austin, 29,860 (22,258); Beaumont, 20,640 (9427).

AGRICULTURE. The Thirteenth Census included statistics of agriculture. These are of date of April 15, 1910. On that date the total number of farms in the State was 417,770, compared with 352,190 in 1900. The land in farms was 112,435,067 acres, compared with 125,807,017 acres in 1900. The improved land in farms was 27,360,666 in 1910, compared with 19,576,076 in 1900. The average acreage per farm was 269.1 in 1910, compared with 357.2 in 1900. The total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$2,217,645,164 in 1910, compared with \$962,476,273 in 1900, an increase of 130.5 per cent. in the decade. The average value of all property per farm was \$5311, compared with \$2733 in 1900. The average value of land per acre in 1910 was \$14.53, compared with \$4.70 in 1900. The farms in the State operated by owners and managers numbered 198,195; by tenants, 219,577. Of the farms operated by owners, those free from mortgage numbered 128,082; those under mortgage, 65,008. The native white farmers numbered 318,988; foreign-born white, 28,864; negro and other non-white, 69,918. Of the non-white farmers 62 were Indians, 44 Japanese, 6 Chinese, and the rest were negroes. The value of the various kinds of domestic animals, poultry, and bees was \$318,646,509 in 1910, and in 1900, \$240,576,955. The cattle numbered 6,934,586, valued at \$132,985,879; horses, 1,170,068, valued at \$84,024,635; mules, 675,558, valued at \$73,979,145; swine, 2,336,363, valued at \$11,639,366; sheep, 1,808,709, valued at \$6,301,364. The poultry of all kinds numbered 13,660,645, valued at \$4,806,642. The acreage, production, and value of the principal crops in 1910 and 1911 will be found in the following table:

	Acreage	Prod., bu.	Value
Corn1911	7,300,000	69,350,000	\$55,480,000
.....1910	6,800,000	140,080,000	88,250,000
Wheat1911	700,000	6,580,000	6,580,000

MINERAL PRODUCTION. The State produces petroleum in large quantities. In 1910 the output from the fields of the State amounted to 8,899,266 barrels, as compared with 9,534,467 barrels in 1909. The decrease resulted from the giving out of wells in the older fields of the State. In 1911 the production was slightly in excess of that of 1910, according to the preliminary estimates of the United States Geological Survey. The output, according to this authority, was 9,000,000 barrels.

The production of coal in the State in 1910

was 1,892,176 short tons, valued at \$3,160,965. The production in 1909 was 1,824,440 short tons, valued at \$3,141,945. The influence of the coal strikes in the Southwestern States extended into bituminous coal fields of northern Texas and resulted in a decrease in the bituminous coal produced. The production of lignite, on the other hand, increased slightly. The coal and lignite mines of the State gave employment in 1910 to 4197 men. The strike in the bituminous mines lasted from April 1 to June 1, and involved a total of 1776 men.

The iron ore mined in the State in 1910 amounted to 29,535 tons, valued at \$34,003, as compared with 6474 tons, valued at \$9318 in 1909.

A considerable amount of silver is mined. The output in 1910 was 364,400 fine ounces, valued at \$196,800. In 1911 there were produced 442,486 fine ounces, valued at \$243,367.

POLITICS AND GOVERNMENT

The legislature met in 1911 and the most important measures will be found noted in the paragraph *Legislation* below. On January 25, Charles A. Culberson was reelected to the United States Senate.

The most important political events during the year were those relating to the question of statewide prohibition. The legislature passed a joint resolution submitting to the voters the question of statewide prohibition, and this was signed on February 10 by Governor Colquitt. An election was held on July 22. The vote was so close that the issue was for a time in doubt. The first returns indicated a victory for the prohibitionists by about 15,000 majority, but on the final count this was changed to a vote of 6000 against prohibition out of a total vote of 462,000. On August 1 concurrent resolutions were introduced in both houses of the legislature asking Governor Colquitt to submit the question of liquor regulation, the legislature having been in special session and able to legislate only on those topics submitted by the governor. He refused the request. The legislature was overwhelmingly pro in sentiment. The governor was an anti, having been the plurality candidate and nominee where several pros were running. The 1912 campaign will be strictly on prohibition issues. In 1911 the pros centred upon Associate-Justice Ramsey of the Supreme Court to oppose Governor Colquitt, anti, for reelection. The Democratic primary, selection equivalent to election, occurs on the fourth Saturday of July, 1912.

On August 28 a concurrent resolution providing for a presidential primary similar to that in vogue in Oregon passed both houses of the legislature. The resolution was in the form of a recommendation directed to the State Democratic executive committee, that at the primary elections in 1912 candidates for President and Vice-President be included on the ballot.

Considerable interest was occasioned by the action of Senator Bailey on March 4 in sending his resignation to Governor Colquitt as the result of the action of 23-Democratic senators voting in favor of a resolution which involved the acceptance of the constitution for Arizona. The constitution provided for the initiative, referendum, and recall of the judiciary, to all of which Senator Bailey was bitterly opposed.

He based his resignation on the fact that he construed the vote of the Democratic senators as giving their support to these political theories and under that impression tendered his resignation. The telegram of resignation was, however, followed by a letter in which it was withdrawn on account of the pressure brought to bear on Senator Bailey by friends in Texas and by the governor himself. The original resignation was not accepted by Governor Colquitt. Several months later Senator Bailey announced that he would not be a candidate for reelection in 1912.

The revolution in Mexico, which resulted in the success of Francisco I. Madero, occasioned much disturbance along that part of the State which is on the border between Texas and Mexico. Large quantities of arms and ammunition were smuggled across the border by Mexican revolutionists, and on February 1 ten troops of the United States cavalry were posted from El Paso to Brownsville to prevent such smuggling. The details of the mobilization of American troops in Texas during the summer of 1911 will be given in the section *Army* in the article UNITED STATES, and in the section *Foreign Affairs* in the same article. In November conditions along the border became such that it was necessary to reestablish a patrol of United States troops along the Rio Grande River to cooperate with the civil authorities in the enforcement of neutrality. This was the result of attempts made by General Reyes and others to set on foot a revolution in Mexico. General Reyes was arrested at San Antonio on the charge of inciting a rebellion against a friendly country in the territory of the United States in violation of the neutrality laws. See MEXICO.

The result of the investigations of the international committee appointed to decide upon the ownership of a strip of land within the present limits of El Paso, which was claimed by Mexico, will be found discussed in greater detail in the article UNITED STATES, *Foreign Relations*. The commission gave El Paso all the lands north of the boundary line of 1864 and ceded the land south of that line to Mexico. As the boundary of 1864 could not be fixed, the actual settlement of the question is still deferred. According to treaties between the two countries, if the river changed to its present course by accretion, the land belongs to the United States, but if it changed by evulsion, the land belongs to Mexico. The commission held that the land was acquired by the United States by accretion as far south as the boundary of 1864 and by evulsion beyond that boundary.

The recall feature of the government of the State was declared constitutional by the Supreme Court in July. The decision arose through a contest in regard to the policy of the school board in the city of Dallas. The policy of this board in 1910 was said to have been opposed to the formally and persistently expressed wishes of the parents of the city. As a result a special election was held upon petition, at which those members of the board who were obstructing the wishes of the electors were recalled, and others were chosen in their places. The superintendent of schools was dismissed. He and several others, who had been recalled, sought an injunction restraining the new board from discharging its duties on the ground that the recall provision of the Dallas charter was

illegal and unconstitutional. The lower court refused to grant the injunction and the Supreme Court affirmed this decision. In its opinion, the court said: "The people of the city of Dallas were invested with the sovereign power of the city, by virtue of the grant of the charter to them, and the legislature has the power to grant to them the right to remove by process of the recall provision any officer who failed to discharge his duty in a manner satisfactory to the people of that city." In answer to the allegation that the recall violated the provision of the constitution for the trial and removal from office of all officers of the State, the court declared that the provision applies specifically to "officers of the State" and held that that expression had the same significance as "State officer." The members of the city board are not State officers and therefore the provision does not apply to them. The provision relating to county officers was also held not applicable, because members of the school board were not county officers.

LEGISLATION. From July 19, 1910, to January 1, 1911, there were three legislative sessions in the State. Two of these were extra sessions of the thirty-first legislature, known as the third and fourth extra sessions, and the third was the regular session of the thirty-second legislature. At the third extra session was passed but one statute of general importance: a law prohibiting exhibition of prize fights and other immoral shows by means of moving pictures. At the fourth extra session several important measures were passed. One of these amended the statutes relating to railroads by providing that where a railroad is sold under a decree of a court, the purchasers can neither act under the old franchises nor incorporate under the existing laws without paying or assuming all subsisting liabilities and claims for death and for personal injuries sustained in the operation of the railroad by the company or any receiver thereof, and for loss of and damage to property sustained in the operation of the railroad by the company or any receiver thereof, and for the current expenses of such corporation, including labor, supplies, and repairs, provided that all such subsisting claims and liabilities shall have accrued within two years prior to the beginning of the receivership, resulting in the sale of the railroad property and franchises. A bill of lading act was passed which governs the issue, delivery, and effect of bills of lading issued by all carriers except express and pipe line companies. The act makes the carriers responsible for the acts of their agents in issuing bills of lading to innocent third holders of such bills. An act was passed establishing a new prison system, making provision for a board of prison commissioners and for the management, control, and treatment of prisoners. An insurance law, passed at the previous regular session of the legislature, was repealed, and a State insurance board was established.

At the regular session of the thirty-second legislature no laws of the first importance were passed. A measure was enacted extending the jurisdiction of the railroad commissioners over all public wharves, docks, piers, elevators, and warehouses.

STATE OFFICERS. Governor, O. B. Colquitt; Lieutenant-Governor, A. B. Davidson; Secretary

of State, C. C. McDonald; Treasurer, Sam Sparks; Comptroller, W. P. Lane; Superintendent of Public Instruction, F. M. Brally; Land Commissioner, J. T. Robinson; Attorney-General, J. P. Lightfoot; Commissioner of Agriculture, E. R. Kone; Commissioner of Insurance, B. L. Gill—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Thomas J. Brown; Associate Justices, William F. Ramsey and Joseph B. Dibrell; Clerk, F. T. Connerly—all Democrats.

STATE LEGISLATURE, 1911. Democrats, Senate 30, House 109, joint ballot 139; Republicans, Senate 1, House 0, joint ballot 1.

The representatives in Congress will be found in the article UNITED STATES, *Congress*.

TEXAS (SHIP). See BATTLESHIPS.

TEXAS, UNIVERSITY OF. An institution of higher learning at Austin, Tex., founded in 1883. The number of students enrolled in the various departments of the university in 1910-11 was as follows: Law department, 300; engineering department, 228; college of arts, 1172; medical department, Galveston, 196. There were 56 members of the faculty of the main university and 83 tutors and instructors. The faculty of the medical department, Galveston, numbered 28. Prof. N. H. Brown was appointed to succeed Professor Scott in the electrical engineering department, and Senator R. E. Cofer was appointed professor in the law department. At a meeting of the Alumni Association, held in June, 1911, a plan was adopted for the raising of an annual sum of \$25,000 to \$50,000 each year for five years for the formulation of plans for the development of the university and higher education in Texas, and the proper presentation to the people of the State. By November 1 \$30,000 had been subscribed and work had already been begun toward the execution of the plan. Such a movement is unique in the history of American universities. The university is supported chiefly by legislative appropriations, and these amounted in 1910-11 to \$295,000. The estimated income was \$108,921. The library contains about 75,000 volumes. The president is Sidney E. Mezes, Ph. D.

TEXTILE MANUFACTURING. -The annual report of new textile mill construction for 1911, compiled by the *Textile World Record* of Boston, stated that 208 new textile mills of various kinds were built, or under construction, in the United States during the year. This is the smallest number reported for any year in the ten years 1902-1911, the next lowest being 222 in 1908. The record for the preceding years was 274 mills for 1910, 289 new mills for 1909. As regards new mill construction, enlargements, and improvements, the year 1911 was comparatively quiet as regards new enterprises, but many manufacturers were active in building and equipping large additions and making improvements in anticipation of improved business conditions.

NEW COTTON MILLS, 1911

	No.	Spindles	Looms
New England:			
Connecticut	1	60,000	1,200
Massachusetts	4	55,500	1,230
Rhode Island	2	20,000
Vermont	1	35,000	650
Total	8	170,500	3,080
Southern States:			
Georgia	1	20,000	500
North Carolina	2	16,000
South Carolina	5	136,000	3,500
Total	8	172,000	4,000

NEW COTTON MILLS, 1911 (Continued)

Middle and Western States:

New Jersey	4	25
New York	1
Ohio	1
Pennsylvania	9	4,920	20
Total	15	4,920	55

During the year there was a marked decrease in the number of cotton mills built, but this was not so pronounced as regards the number of spindles, as the establishments for the most part were of larger size than usual. In mill construction South Carolina led all other States, having 80 per cent. of the spindles and looms in new Southern mills, and giving the Southern group of States a slight actual gain over New England in new mill construction for the year, or 172,000 spindles in new mills in the South as against 170,500 spindles in new mills built in New England. New cotton mills were built in four New England States, and three Southern States added to their number of mills. The total number of spindles in all new cotton mills was slightly less than 50 per cent. of the number in 1910, and approximately 25 per cent. of the record year, 1909.

During the year 1910 there was published the preliminary report of the Thirteenth Census, dealing with the textile industry. This census was made in the year 1909, and its figures were of considerable interest in connection with industrial development since the previous census of 1899, and the economical and political discussions of the tariff and other matters. The year 1909 was not a record year in most branches of the textile industries, but the statistics form some idea of the development of these great manufacturing industries. The total value of products in 1909 as compared with those of a decade previous have been summarized as follows (P. C. = per cent. increase):

Industry	Total value of products		P. C.
	1909	1899	
Cotton	\$ 616,297,000	\$332,806,000	85
Wool	419,826,000	238,745,000	62
Silk	196,425,000	107,256,000	57
Knit goods	198,812,000	95,483,000	108
Carpets and rug ..	71,864,000	48,192,000	49
Felts	11,853,000	6,462,000	83
Shoddies	7,434,000	6,731,000	11
Fur felt hats	47,501,000	27,811,000	71
Wool felt hats	4,382,000	3,592,000	22
Total	\$1,574,384,000	\$867,078,000	45

In examining these figures it must be realized that the increase of population during the period under consideration was 21 per cent., while in many cases the cost of material has been in a greater proportion than the quantity; thus the quantity of cotton used in 1909 increased but 29 per cent. over 1899, but its cost was greater by 120 per cent. In this industry, as in others, there was a greater use of finer grades of raw material. Again, the growth of new industries was shown by the fact that the quantity of silk used in the cotton industry increased from \$1,784,000 in 1899 to \$5,776,000 in 1909.

The world's active cotton spindles and mill consumption (in bales) of raw cotton in 1911 and 1900 are shown in the table at top of page 689 (statistics for the United States from the Bureau of the Census, for the other countries from various reliable sources):

United States:			
Cotton-growing States	Year	Spindles	(bales) ¹
	1911	11,077,000	2,328,000
	1900	4,368,000	1,523,000
All other States	1911	18,438,000	2,377,000
	1900	15,104,000	2,350,000
Europe:			
United Kingdom	1911	54,523,000	3,782,000
	1900	45,500,000	3,330,000
Germany	1911	10,480,000	1,685,000
	1900	8,000,000	1,400,000
Russia	1911	8,872,000	1,625,000
	1900	7,500,000	1,350,000
France	1911	7,300,000	960,000
	1900	5,500,000	700,000
Austria-Hungary	1911	4,564,000	749,000
	1900	3,300,000	675,000
Italy	1911	4,282,000	790,000
	1900	1,940,000	475,000
Spain	1911	1,353,000	315,000
	1900	2,615,000	400,000
Switzerland	1911	1,481,000	100,000
	1900	1,550,000	125,000
Belgium	1911	1,327,000	217,000
	1900	920,000	170,000
Portugal	1911	476,000	65,000
	1900	230,000	60,000
Netherlands	1911	431,000	79,000
	1900	300,000	70,000
Sweden	1911	528,000	95,000
	1900	360,000	85,000
Denmark	1911	80,000	21,000
	1900	40,000	15,000
Norway	1911	74,000	11,000
	1900	35,000	10,000
Other European countries	1911	200,000	60,000
	1900	130,000	42,000
British India	1911	6,250,000	1,650,000
	1900	4,945,000	1,162,000
Japan	1911	2,180,000	1,060,000
	1900	1,274,000	700,000
China	1911	831,000	350,000
	1900	550,000	200,000
Brazil	1911	1,000,000	370,000
	1900	450,000	85,000
Canada	1911	855,000	119,000
	1900	550,000	110,000
Mexico	1911	630,000	140,000
	1900	470,000	125,000
All other countries	1911	260,000	65,000
	1900	50,000	15,000
Total	1911	137,792,000	19,013,000
	1900	105,681,000	15,177,000

¹ The quantities for the United States are given in running bales, except that round bales are counted as half bales and foreign cotton has been reduced to equivalent 500-pound bales. Linters are included. For other countries the quantities are given in equivalent 500-pound bales.

Imports and exports of raw cotton and of cotton manufactures for selected countries are shown in the table on page 600.

THAYER, NATHANIEL. An American capitalist, philanthropist, and art connoisseur, died March 21, 1911. He was born in Lancaster, Mass., in 1852 and graduated from Harvard College in 1871. He had a large fortune and for many years held a commanding position in the financial and business life of Boston. He was an officer and director in many financial institutions. In 1887 he became a member of the Museum of Fine Arts and retained this office until his death. He made many large contributions to the funds of that institution. He was also interested in philanthropic objects and was a trustee of the Massachusetts General Hospital, the McLean Hospital, and the Conalescent Home at Waverly.

THIBY, JOHN HENRY. An American bibliophile and philanthropist, died June 23, 1911. He was born in Belgium in 1822 and received his education in the normal schools of that country. In 1859 he removed to the United States, where he opened a second-hand book store. He soon achieved a reputation as a collector, and among his patrons were Henry Ward Beecher and Horace Greeley. At the age of seventy years he retired from active work and revisited his native land. He returned to New York and engaged again in the second-hand book business. He was greatly interested in educational matters and in 1883 became a school commissioner of Long Island City. While in this office he conceived the idea of school savings banks and organized a system which spread throughout the country until hundreds of such banks came into existence, with aggregate deposits of \$15,000,000. He wrote several works on educational subjects, the best known of which is *The Early Schools of Long Island*. He also wrote many pamphlets on financial and economic subjects.

THOMAS, ABNER B. An American jurist, died January 17, 1911. He was born in Brooklyn in 1844. He was trained in early life as a civil engineer, but at the age of twenty-one abandoned that profession to enter the law. He studied at Bridgeport, Conn., and in 1866 began the practice of law in New York City. He was appointed dean of the Metropolitan Law School, which was afterwards merged into the New York Law School. While dean of the school he wrote a number of text books which attracted much attention. Of these perhaps his best known are *Mortgages on Real and Personal Property in the City of New York*, published in 1887. He was originally a Republican in politics, but in 1886 joined the Henry George movement and took an active part in the campaign. He was nominated for justice of the Supreme Court and was defeated. He afterwards became active in the New York county democracy and in 1899 was nominated as candidate for surrogate. He was elected and held this office until the time of his death.

THOMAS ORCHESTRA. See **MUSIC.**

THOMPSON, DENMAN. An American actor, died April 14, 1911. He was born at Girard, Pa., in 1833. While he was still very young his parents removed to New Hampshire. He studied at Mt. Caesar Seminary in Swanzey. He early showed a talent for acting and while still in early boyhood went to Boston. He joined a circus and for a short time traveled with it as a tumbler. In 1850, however, he secured his first chance on the stage in a minor part. After a varied career on the stage, in which he played a number of unimportant rôles, he had in Pittsburgh in 1875 an inspiration to put on the stage some of the rural characters whom he had known in Swanzey, and he wrote a short play called *Joshua Whitcomb*. This was successful and it was several years later made into a longer play in three acts, called *The Old Homestead*. In the rôle of Joshua Whitcomb Mr. Thompson appeared in this play until shortly before his death. He made a large fortune, for the play was popular in all parts of the country. He played long engagements in the large cities and toured the country year after year. He last appeared in the part in the winter of 1910.

Country	Year	Raw cotton (equiv- alent 500- pound bales)	Value of cotton manufactures			
			Total	Cloth	Yarn and thread	All other

1 For the year 1909. 2 For the year 1910. 3 Included in "all other."

THOMPSON, HENRY. A son-in-law of John Brown, died February 8, 1911. He was born in 1822. In 1850 he married Ruth Brown, the daughter of John Brown, in North Elba, N. Y. At this time the sons of John Brown had moved to Kansas, and here Thompson and his wife joined them in 1854. He took part in the attacks of his father-in-law on the slaveholders in Kansas, and in the "Battle of Black Jack," in which Brown with a band of twenty-five men worsted a greatly superior number of slaveholders, he was terribly wounded. With his brothers-in-law, Owen and Salmon Brown, he lay concealed for six weeks, suffering from his wounds and from malarial fever. John

Brown at last conveyed him out of Kansas to Iowa. Thompson returned with his wife to North Elba. Some years later he went to California with his wife, where he remained in Pasadena until the time of his death.

THOMSON, J. J. See PHYSICS.

THORNTON, JOHN RANDOLPH. United States senator (Democrat) from Louisiana. He was born in Iberville parish, La., in 1846. He entered the Louisiana State University, and in the beginning of 1863 he volunteered in the Confederate army, in which he served as a private until the close of the Civil War. Until 1887 he followed agriculture as an occupation, but after studying law received a license to

practice, and followed his profession until his election to the Senate. From 1878 to 1880 he served as judge of the Rapides parish. He was a member of the State constitutional convention of 1898, and was one of the three Louisiana commissioners to the conference on uniform laws for the United States. He was appointed on August 27, 1910, to the Senate to succeed S. D. McEnery, deceased, and was elected by the General Assembly in 1910 to fill the unexpired term of Senator McEnery. His term of office will expire in 1915.

THURSTON, KATHERINE CECIL (MADDEN).

An English novelist, died September 6, 1911. She was born in Cork, Ireland, in 1879, and was educated privately. She married in 1901 Ernest Temple Thurston, who was also a writer. At the suggestion of her husband she began to write, and her first short story was accepted by a magazine. In 1903 she published *The Circle*, and in the following year made a great success with *The Masquerader*, which was published in England under the title, *John Chilcote, M. P.* This book ran through many editions and was dramatized by her husband. In 1906 she published *The Gamblers*, which was also a success. She secured a divorce from her husband in 1907. Among her other published novels are *The Fly on the Wheel*, and *Max*.

TIBET. A country in central Asia; a Chinese dependency. Area, 463,200 sq. miles; population, between three and six millions. Lhasa, the capital, has between fifteen and twenty thousand inhabitants. The total trade in 1910-11 was about £245,000. India receives from Tibet borax, salt, animals, wool, and musk, and contributes textiles, coral, and grain. The Dalai Lama, the government head, who returned to

After his graduation he was appointed second lieutenant of the mounted rifles. He was promoted to be first lieutenant of that branch of the service, and in 1861 was made captain in the Third Cavalry. He served throughout the Civil War, and in 1867 was promoted to be major of the Seventh Cavalry. He became lieutenant-colonel in 1883 and colonel of the Ninth Cavalry in 1889. In 1891 he was retired at his own request after forty years' service. He was advanced to the rank of brigadier-general. He saw service in the Civil War in New Mexico, and served also with Sherman's expedition to Chattanooga in 1863.

TIMBER IN NATIONAL FORESTS. See FORESTRY.

TIMOR. The largest island of the Lesser Sunda group, belonging partly to the Netherlands and partly to Portugal. The area is estimated at 12,593 sq. miles (7330 belonging to Portugal), and the population at 400,000 (200,000). Dili is the capital and chief port. Imports and exports (Portuguese Timor) in 1909 amounted to 394,170 and 312,105 milreis respectively. The budget (1909-10) balanced at 200,000 milreis. F. da Camada was the Portuguese and E. F. J. Loriaux the Dutch governor in 1911.

TIREYNS. See ARCHEOLOGY.

TITANIUM. See CHEMISTRY, INDUSTRIAL.

TOBACCO. The tobacco crop of 1911 in the United States was 2 per cent. under the five-year average in amount and 5.3 per cent. under in value. The year's crop is estimated at 905,109,000 pounds, and is given a farm value of \$85,210,387. The acreage and production (in pounds) in 1911, compared with 1910, and the price (in cents) per pound in 1911, are given in the following table for the principal States growing the crop, as reported by the United States Department of Agriculture:

	Acreage		Production		Farm value Dec. 1		Cents per lb.
	1911	1910	1911	1910	1911	1910	
Massachusetts ..	5,600	5,500	9,240,000	9,515,000	\$1,848,000	\$1,427,250	20.0

Lhasa in January, 1910, after having been driven out by British troops in 1904, again fled toward India when Chinese troops entered early in 1911. It is reported that the Wai Wu Pu (Chinese foreign office) has announced that the country is to be converted practically into a Chinese province. Pending the consummation of this policy, the Chinese resident at Lhasa is to conduct all Tibet's foreign affairs, and the Dalai Lama is no longer to exercise the power of concluding treaties. See EXPLORATION.

TILFORD, JOSEPH GREEN. An American soldier, died February 24, 1911. He was born at Georgetown, Ky., in 1829 and graduated from the United States Military Academy in 1851.

Figures are not available for the world's crop in 1910 or 1911. In 1909 it amounted to 2,587,466,000 pounds. Of this, the United States produced 949,357,000 pounds, Porto Rico 10,000,000, Canada 13,373,000 pounds, Cuba 59,323,000 pounds, South America 117,306,000 pounds (principally Brazil, Argentina, and Paraguay), European countries 644,157,000 pounds, Dutch East Indies 116,942,000 pounds, Japanese Empire 91,845,000 pounds, Philippines 40,258,000 pounds, and Africa 22,227,000 pounds. In 1909 the United States produced 36.5 per cent. of the world's crop, and for the past five years the average was 31 per cent. The exports from the United States comprised 42.3 per cent. of the

world's exports of tobacco. The amount in 1911 continued large, being valued at \$39,000,000, or one million more than the previous year.

The United States internal revenue receipts from tobacco in the year ended June 30, 1911, totaled \$67,005,950.56, an increase of \$8,887,493.53 over the previous year. In the calendar year 1910, 6,810,098,416 cigars were made weighing more than 3 pounds per thousand, and 1,118,135,635 weighing 3 pounds or under. This was an increase of 142,323,501 in the former class and of 75,112,076 in the latter over 1909. In the same year the number of cigarettes made weighing over 3 pounds a thousand was 19,374,077, and weighing 3 pounds or under was 8,644,335,407, an increase of nearly two billion in the latter case. Other tobacco manufactures were as follows: Plug 174,352,625 pounds, twist 14,580,022 pounds, fine cut 12,857,930 pounds, smoking tobacco 214,056,402 pounds, and snuff 31,445,178 pounds.

The United States Census has made a special report on tobacco manufactures in 1909. It shows that there were 15,822 establishments in the tobacco industry, as compared with 16,829 in 1904, a decrease of 6 per cent. In 1909 these establishments were capitalized at \$245,660,000, as against \$323,982,000 in 1904, a decrease of 24 per cent. The manufactured products in 1909 were valued at \$416,895,000, an increase of 26 per cent. over 1905.

A method devised for applying artificial heat in curing cigar tobaccos has been used successfully in the Connecticut Valley. The system not only does away with injury from pole sweat, but insures better and more uniform curing. See **AMERICAN TOBACCO COMPANY**.

TOGOLAND. A German protectorate, on the west coast of Africa, covering 33,700 sq. miles and having about a million inhabitants. Lome is the capital and chief port. Togoland imported goods in 1909 to the value of 11,235,000 marks, and exported home products amounting to 7,372,000. The budget balanced (1911-12) at 3,343,700 marks. There are 298 kilometers of railway, and 13 post offices. Dr. E. Brückner was governor in 1911.

TOLEDO. See **OHIO**.

TONGA ISLANDS, or FRIENDLY ISLANDS. A group of islands in the South Pacific; a British protectorate. Aggregate area, 390 sq. miles; population (1908), 22,734. Nukualofa, on the island of Tongatabu, is the capital. The imports and exports in 1909 amounted to £152,870 and £217,155 respectively. The revenue in 1909 was £40,456 and the expenditure £34,739. Jioaji Tubou II. is the native king; W. Telfer Campbell, British agent and consul in 1911.

TONGKING. A protectorate in French Indo-China, covering about 46,223 sq. miles and having an estimated population of 5,896,510. Hanoi, the capital, has 103,238 inhabitants. The imports in 1908 amounted to 59,910,100 francs and the exports to 60,468,800. The revenue and expenditure (1911 budget) balanced at 6,282,696 piasters. M. Simoni was acting resident-superior in 1911. See **FRENCH INDO-CHINA**.

TOTEMISM. See **ANTHROPOLOGY**.

TOWN PLANNING. See **ARCHITECTURE**.

TOWNSEND, CHARLES ELROY. United States senator (Republican) from Michigan. He was born in Concord, Mich., in 1856, and was educated in the common schools and in the University of Michigan, where he remained one

year. In 1895 he was admitted to the bar, and practiced his profession in the city of Jackson until his election to the Senate, with the exception of terms in the Fifty-eighth and Sixty-second congresses, inclusive. He was nominated for United States senator at the primaries on September 7, 1910, receiving a majority of 41,000 over Senator Burrows, who was elected by the State legislature June 18, 1911, receiving 115 votes to 14 for his Democratic opponent (see **MICHIGAN**). His term of service will expire in 1917.

TRACTION PLOW. See **AGRICULTURE**.

TRADE UNIONS. INTERNATIONAL SECRETARIAT. The seventh biennial conference of the International Secretariat was held at Budapest, Hungary, August 10-12, 1911. One of the interesting features of that conference was the rejection of a delegate sent from the United States by the Industrial Workers of the World. This was done under a rule admitting representation from only one body in each country, the American delegate being sent by the American Federation of Labor. The propositions presented at the 1909 conference, one of which favored the formation of an International Federation of Labor, and the other of which favored the organization of the International Congress of Labor, were sent back to all the national bodies for further discussion. The report of the secretary showed that the total membership of all trade unions affiliated with the organizations represented was 6,033,500, of whom nearly 2,000,000 were in Germany and 1,700,000 in the United States.

THE McNAMARA CASE. Following the destruction of the Los Angeles Times building in October, 1910, there were numerous assertions that the explosion was the work of trade-union leaders. This was vigorously denied by these leaders, some of whom demanded that the public suspend judgment until the facts in the case be determined. There followed then in May, 1911, the arrest of J. J. McNamara, secretary of the International Association of Bridge and Structural Iron Workers, and his brother, J. B. McNamara, as the principals in the case. The arrest of the McNamara brothers was brought about by Detective William J. Burns, who had been employed by the National Erectors' Association. Again there broke out in some portions of the press general denunciation of the violent methods of trade unions and again trade-union leaders as vigorously replied to charges which they deemed unfair. In St. Louis Mr. Gompers, president of the American Federation of Labor, demanded that the country should not pass judgment upon these particular men or upon the trade-union movement until further information was gathered. He expressed his conviction that the McNamaras were innocent, but declared his hope that the guilty ones would be brought to justice. Then came a consultation of the leaders of several international unions at Indianapolis at which was formed the McNamara ways and means committee. It was determined to prosecute those who had arrested J. J. McNamara and, as they asserted, spirited him from Indianapolis to Los Angeles. This suit was pending at the end of the year. It was also decided to raise a fund for the purpose of maintaining the defense of the accused men. This committee then issued circulars and pamphlets appealing to the international unions to contribute not less than twenty-five cents per member to the defense

fund. They also devised a McNamara button for Labor Day, selling at five cents; and a McNamara stamp selling at one cent. These were designed not only to raise money, but also to enlist public attention. The money contributed was under the exclusive control of the president and secretary of the federation. The total amount of money raised, as stated by Secretary Morrison, was \$200,000. As this was raised it was turned over to the attorney, Clarence S. Darrow, to be expended as he deemed wise. No detailed account of the manner of expenditure had been given up to the close of the year, but such a statement was promised. It was asserted by Detective Burns that a much larger fund than reported was raised.

In making this appeal for funds the leaders repeatedly laid great stress upon the assertion of J. J. McNamara to Mr. Gompers that he was innocent, and that the trade-union world could rely upon the soundness of his case. Indeed there was a very considerable belief on the part of the public that the accused men were not guilty. The well-known bitter hostility of the *Times* to trade unions in general, and the manner in which J. J. McNamara was arrested while in council with other leaders in the International Bridge and Structural Iron Workers' Union, had become a cause of great controversy and laid the basis for the charge by trade-union leaders that the whole affair was a "frame up" by Mr. Burns. On the other hand, in the minds of many, the quality of the circumstantial evidence, the general efficiency and integrity of Detective Burns, the fact that 113 dynamitings of jobs done by members of the National Erectors' Association had been perpetrated since that association declared in favor of the open shop, the confession of Ortie McManigal that he had taken part in a score of these dynamitings as the agent of J. J. McNamara, created great probability of guilt. The course of the union leaders in calling for a defense fund was looked upon by many persons both within and without trade-union circles as a prejudgment of the case; moreover, the enlistment of the support of a greater part of the trade-union world in the defense of the accused men discredited the trade-union movement as a whole. Here and there unions stood out against the demand for contributions on the ground that insufficient facts for judging the situation were available. It was held by these protestants that if guilty the defendants should be punished, and the ranks of union labor rid of such dangerous leaders. But not only did the unions raise a defense fund, but many of their publications encouraged the belief that the whole matter was a conspiracy against organized labor.

When, therefore, the counsel for the defense concluded that the case against them "left no loop-hole" and J. B. McNamara pleaded guilty to the *Times* disaster and his brother to the dynamiting of the Llewellyn Iron Works, the entire country and especially the trade-union part of it was much astonished. Considerable discredit at once attached to the trade-union leaders and that portion of the trade-union press that had prejudged the case and had sought to confuse the issue. Mr. Gompers seemed especially overcome by the confession, but lost no time in asserting that he had been grossly deceived and that being guilty the McNamaras should suffer their due punishment. This statement was, however, almost immediately followed

by the assertion by Detective Burns that Mr. Gompers had known for months that the McNamaras were guilty, and that Mr. Gompers himself had attended a conference at Detroit at which plans were laid for the dynamiting of five structures. These charges in turn were vigorously denied by Mr. Gompers. Moreover, it was brought out that the books of the Iron Workers' Union showed that Secretary McNamara had been authorized to spend \$1000 per month "for organizing purposes"; no items were made to show the manner of expenditure. It was charged that this money was used to pay J. B. McNamara and Ortie McManigal for the dynamitings. These suggestions of implication of union leaders in such affairs raised much discussion as to the extent to which trade-union leaders in general would sanction the use of dynamite in trade controversies. The final result was an inevitable withdrawal of some public esteem from the trade-union movement as a whole. The prompt and vigorous revulsion in trade-union circles, however, did much to restore public confidence in the general attitude of the rank and file of trade unionists toward the use of violent and destructive methods.

Following the confession the council of the American Federation of Labor, constituting the McNamara ways and means committee, issued a statement in which was set forth the manner in which they had been led to believe in the innocence of the McNamaras. They then went on to declare that "violence, brutality, destruction of life and property are foreign to the aims and methods of organized labor in America." The statement declared the McNamaras to be traitors to the cause of labor, expressed satisfaction with their conviction and punishment, and contended that organized labor should not be held implicated in any way in such methods. They welcomed any investigation.

On the whole this experience was the most impressive and trying which trade unions have experienced in this country in many years. It forced the entire movement to face the question of how far they should sanction the use of strong-arm methods and secret policies for achieving their ends. While, of course, there were some leaders and some trade-union members who would favor the use of destructive and fanatical methods, it was made sufficiently clear that the vast majority of trade-union leaders and members would not sanction such leadership or such methods. The final effect, therefore, upon the public estimate of trade unionism was not so serious as at first seemed likely. It was an almost universal opinion that the trade unions must "clean house," that they must rid themselves of dangerous leaders practicing un-American methods. One outcome of the entire matter was a powerful stimulus to the furtherance of conciliatory methods. See CALIFORNIA, *Politics and Government*.

FEDERAL COMMISSION ON INDUSTRIAL RELATIONS. On December 30, 1911, was presented to President Taft a petition for the appointment of a commission to inquire into industrial relations in the United States. This was signed by leading social workers and economists of the country and also by a few leading business men. This petition was a direct outgrowth of the McNamara case and the evidence there brought to light of the use of violent and destructive methods in the prosecution of trade disputes. The petition called attention to the fact that the

use of force with dynamite, intimidation, spying, evictions, and other unjust methods were too commonly practiced in the contests between labor and employers. It also called attention to the fact that the courts have been slow to adjust judicial decisions to new industrial conditions, but have been very ready to facilitate the use of injunctions, of militia, and other repressive measures in the support of employers. It then called for a federal commission of great scientific competence and with abundant power and resources. This commission should investigate the conditions of labor in the structural iron trade; it should inquire into breakdowns of the machinery for the settlement of trade wars; it should investigate the economic and social cost of strikes; it should review the record of relations between trade unions and associations of employers; it should study and report on the activities of federal and State bureaus of labor; and it should inquire into the newer methods of arbitration and conciliation and minimum-wage boards. The President was reported to have received the petition with interest and favor and the appointment of such a commission was deemed probable.

GREAT BRITAIN. *Sequel of the Osborne Decision.* Ever since the decision of the House of Lords in December, 1909, sustaining a judicial decision in the case of Osborne vs. The Amalgamated Society of Railway Service, in which the trade union was declared incompetent to carry on political activities by the use of trade-union funds, efforts have been made by various unions to secure parliamentary enactment restoring to them their lost privilege. Not only were the unions supporting some forty parliamentary representatives, but they were also engaging in local political activities. They demanded a law authorizing them to pay legislative representatives and to defray the expenses of other political activities out of trade-union funds. The government at first made a counter proposition that parliamentary representatives be paid by the treasury, but this met with determined trade-union opposition. Meanwhile the unions instituted a system of voluntary contributions by their members for the purpose of paying their representatives and defraying the expenses of their political activities.

In a case decided about the first of May a court at London held that a voluntary levy for the election or support of labor representatives in Parliament or on local public bodies, which had been instituted by the Amalgamated Society of Engineers, was *ultra vires*. The court found that such a levy was only nominally voluntary, being in fact compulsory and therefore in violation of the principle laid down in the Osborne decision. The government had, early in the year, introduced the Trade Union's bill to overcome the defects of the Osborne decision. This bill would permit trade-union funds to be used for both local and national political purposes, but only on condition that a majority of the members of a union so voted, and on condition that the opposing minority members should not be required to make any contributions to the funds to be so used. That is, the funds to be used for political purposes would be raised by a special voluntary levy and no penalty could attach to those minority members who did not favor political action. The chief argument against this proposal, as expressed by Mr. Ramsley McDonald and other labor leaders, was that,

if the right of the unions to engage in political action be once recognized, then the minority ought not to have the privilege of withdrawing their support from the policy favored by the majority. In answer to this the government stated that while the union should have power to engage in political action, yet every member should be protected in the freedom of his political opinions. Another source of opposition was found in the idea expressed by the London court as above noted. The bill provided that any member who wished to be exempted from paying dues to the political fund must give formal notice in writing. Opponents held that this would make such a member a marked man and that through pressure of various sorts he would be practically compelled to fall in line with the policy of the majority of members.

The Labor party's bill on the same issue would give the trade unions unqualified right to use their funds for securing the election of representatives in Parliament or any other public bodies or for the purpose of maintaining or paying the expenses of such representatives.

Strikes. A very notable feature of the trade-union movement in Great Britain in 1911 was the great strike of the Transport Workers, including seamen and dockmen, accompanied by the strike of railway men. Nothing in recent years has shown so impressively the power and the solidarity of the workers in Great Britain. At least 100,000 railway men received an advance of twenty-five cents per week and 150,000 seamen and dockers received advances of from \$1 to \$2.50 per month. See **STRIKES**.

Conciliation. The great amount of labor unrest, together with the breaking down of the conciliation agreement in the railway world, led to the formation of an industrial council late in the year. (See **ARBITRATION AND CONCILIATION, INDUSTRIAL**.) While the attitude of the trade-union leaders in general was favorable to the perfection of the machinery for arbitration and conciliation, nevertheless there was some expression of unwillingness to surrender the strike privilege. While, of course, this new proposition did not deny the right to strike, it was considered by some a step in that direction. These held that the right to strike is essential to the power and effectiveness of the trade-union movement, and that every step in its restriction should be accompanied by fully compensatory representation of the unions on arbitration committees.

Organization. Following the great strikes of the summer, a wave of organization swept over the United Kingdom which not only increased the membership of most unions, but resulted in the creation of new unions. Women workers increased their organization; fishermen, previously unorganized, formed a union; laundry workers also took steps to organize; bartenders started a new union of one thousand members in London in September. Furthermore, a move was started for the publication of a daily trade-union paper. This was supported by a number of the stronger unions who promised to invest sums ranging from £5000 to £12,500 each in the undertaking. The title of the paper was to be the *Daily Citizen*, to be published probably in Manchester.

GERMANY. The strong position of the German trade unions has shown itself very clearly in the betterment of wages and shortening of hours,

in many cases without either strike or lockout. In 1910, 829,000 persons received wage increases and 346,000 reduction in hours, these being respectively the largest number in any single year. Most of those benefited were trade unionists. Between 1905 and 1910 about 400,000 members of the building trades unions received an average increase of 2.8 marks per week per person. This was mainly due to an extensive lockout in 1909-10. In the metal trades 125,000 persons received an advance of 1.4 marks per week per person. Similarly in the printing, the wood-working, the clothing and textile, the food and drink, transport, and retail trades many thousands received weekly advances of 1.5 marks to 2 marks in wages. Taking all of the trades together 53 per cent. of those receiving increased wages were neither on strike nor lockout, this percentage contrasting with 73 per cent. in 1909 and 88 per cent. in 1908. Of the total number of workers receiving wage increases in 1910, 48 per cent. were in the building trades and their increase amounted to 61 per cent. of the total increase in wages. The total number of wage earners who received a reduction of working hours in 1910 was 344,570, the reduction amounting to 756,594 hours per week. The greater proportion of these workers were in the building trades and the metal trades. The total number of persons benefited was greater than in any recent year, although the total reduction of hours was exceeded in 1906-7.

Membership and Finances. German trade unions have experienced a more rapid growth in recent years than those of any other principal country. The report of the General Commission of Trade Unions issued in November showed that the total membership in 1910 was 2,688,144. Of this number, 2,017,298, or about 80 per cent., belonged to unions affiliated with the general commission. The Christian Trade Union Federation reported 295,129 members and the Hirsch-Duncker Federation reported 122,579. There were in addition 253,146 members of independent unions; Roman Catholic and Protestant unions with 198,840 members; "patriotic" unions with 33,284 members; and "yellow" unions with 79,991 members. The last two groups are not trade unions in the strict sense of the word; they are labor unions composed very largely of strike breakers. The aggregate membership in 1910 was nearly three times as great as in 1901, the increase during the ten years having been continuous except for a slight recession in 1908.

The financial strength of the German trade unions has also become remarkable. The income in 1910 of the unions affiliated with the general commission was 64,372,190 marks; that of the Christian unions, 5,490,004 marks, and that of the Hirsch-Duncker, 2,926,693 marks. The total expenditures of the general commission unions was 57,928,566 marks; of the Christian unions, 4,916,270 marks; and of the Hirsch-Duncker unions 2,532,361 marks. Strike and lockout benefits amounting to 20,413,343 marks were paid by the general commission unions; 1,239,500 marks by the Christian unions; and 339,931 marks by the Hirsch-Duncker unions. The funds on hand held by the general commission unions amounted to 53,000,000 marks at the close of 1910, as compared with 6,000,000 marks for the Christian unions and 2,000,000 marks for the Hirsch-Duncker unions. Among the other benefits paid by the unions affiliated

with the general commission were the following: Out-of-work, 6,076,000 marks; traveling, 1,016,000 m.; removal, 316,000 m.; sick, 9,029,000 m.; invalidity, 505,000 m.; distress, 540,000 m.; legal assistance, 330,000 m.; death, 884,000 m.

The metal-working and ship-building trades have the greatest number of trade-union members, there being 430,744 workers in those lines in the General Commission Trade unions, 28,627 in the Christian unions, and 40,584 in the Hirsch-Duncker unions. The building trades rank second in trade-union membership, having a total of 403,948. Then come the transport and commerce trades, wood-working, and mining, each with 200,000 or more trade unionists.

Secretariats. A typical feature of German trade-union development is the maintenance of workmen's secretariats or secretaries. These secretaries are usually trade-union leaders who have qualified themselves by the study of labor laws and conditions to serve in the position of legal adviser to workmen. They receive fixed salaries and settle many union complaints. In 1911 there were 113 of these secretaries, besides 203 information agencies conducted by local trade-union bodies. The character of the cases dealt with by these secretaries is shown by the following statistics: Out of 610,897 cases handled in 1910, 30 per cent. related to workmen's insurance; 29 per cent. to civil law; 14 per cent. to labor and service contracts; 15 per cent. to local and central government regulations. Other cases dealt with the penal law and the labor movement. The information agencies dealt with 46,346 on the same subjects.

TRANSMISSION OF ELECTRIC POWER.

New developments of importance in this field were conspicuously lacking in America in 1911. The new projects undertaken were of a minor character and the improvements in apparatus related largely to matters of detail. The attention of investigators has been diverted largely from the field of insulation and lightning protection to that of line losses through corona discharge. Thorough study has now reduced this complex phenomenon to a working basis of practical use to the designer. The influence of this factor on the future limitations of high voltage are more fully understood. The tying of many small powers into network systems continues to increase. There has developed a marked tendency to the use of water wheels of very large power. The Pacific Coast Power Company has installed Francis turbines of 20,400-horsepower. At the most favorable load the efficiency of these machines is reported to exceed 85 per cent. The growth of switching and transforming apparatus for outdoor installation is worthy of note. These types are now available for 110,000-volt lines and permit the connection of small and moderate loads to such lines without the installation of a substation.

European nations have been much more active than American in new developments. In Austria plans have been matured for the development of 200,000 horsepower to Paris from a site on the Danube. A project was developed to furnish

200,000-horsepower to Paris from a site on the Rhone at a distance of more than 300 miles from the city. While the three-phase alternating-current system has been the most conspicuous in recent years, the advocates of the high-pressure direct-current system have not been idle. The Montiers-Lyons system in southern France is to be greatly increased by interconnection with new plants at Bridoire and Bozel. Each of the generators of the remodeled system is to produce a constant direct-current of 150 amperes at voltages ranging from 7200 to 18,250. The generators are connected in series when operating, changes of load being met by adding to or decreasing the number of machines in circuit and by field control of the separate units. At the receiving end the power is transformed through motor-generator sets, the motor elements of which are in series with the line. When the project is complete it will represent an aggregate of 28,000-horsepower with a maximum voltage of 127,000 volts when all units are operating.

There are many indications that long-distance transmission from steam and gas-engine plants located at the mines or at coke-oven plants will soon become an important factor. The development of boilers capable of supplying a 10,000 kw. turbine and of large gas engines of 6000-horsepower to be operated by coke-oven gas, which is now a waste by-product, point to the early practicability of such transmission plants.

TRANSVAAL, THE. A province of the Union of South Africa (q. v.). Capital of the Union and provincial capital, Pretoria.

AREA, POPULATION, ETC. Area (estimate), 110,426 sq. miles; population in 1904, 1,262,698; estimate in 1911, 1,676,611.

Pretoria had (1911) 48,609 inhabitants; Johannesburg, 237,220. Schools (1908), 624 primary (pupils, 44,451), 220 native (10,725). In secondary schools the pupils numbered 1891; in the normal college, 94.

INDUSTRIES. Stock-raising is the principal occupation of the agricultural population, though other branches of agriculture are engaged in. Livestock (1910): 125,951 horses, 899,673 cattle, 3,011,906 sheep, 167,879 hogs. Wheat (520,280 bu. in 1909), and tobacco (2,891,000 lbs.) are grown.

Persons employed in the mines (March, 1909), 229,015. No Chinese labor is now employed. The output from the mines is shown below:

	1907	1908	1909
Gold (fine oz.).....	6,450,740	7,056,266	7,299,413
Diamonds (kt.).....	2,062,855	2,022,687	1,877,486

Value of total gold output 1884—June 30, 1910, £273,559,758. Value of base metals other than shown in table above (1909), £47,596.

COMMERCE, FINANCE, ETC. The imports and exports for the calendar year 1909 are stated at £19,643,615 and £34,128,956 respectively.

Principal imports (1909): Live animals, £1,802,701; machinery, £1,716,624; clothing, etc., £1,499,890; chemicals and dynamite, £1,371,929; cotton goods, £710,787; iron and steel

work, £687,618; wheat, flour, etc., £507,219; hardware, £495,006; sugar, £470,628; boots and shoes, £425,010. Exports: Gold, £30,660,886; diamonds, £1,238,826; wool, £309,922; hides, skins, etc., £185,207; horses and mules, £140,186; tobacco, £105,453; coal, £43,841. Great Britain supplied imports and received exports valued at £7,130,270 and £32,216,619 respectively; British possessions, £981,892 and £1,391,966; other countries, £3,859,552 and £105,440; balance, interchange of South African produce.

The revenue and expenditure for the year ended May 30, 1910, are given as £5,585,637 and £5,974,491 respectively.

Total length of railways in operation (1909), 2627½ miles; under construction, 64½. Telegraph lines, 10,287 miles; telephone wires, 28,615; post offices, 450. The province is governed by an administrator (1911, J. F. B. Rissik), aided by a legislative council and an executive committee.

TRAVEL, BOOKS OF. See **LITERATURE, ENGLISH AND AMERICAN.**

TREADWELL, GEORGE A. An American metallurgist and mining promoter, died November 11, 1911. He was born in Maine in 1836, and studied geology and metallurgy at Yale College. In 1878 he became superintendent of the Vulture Mine in Arizona and in this capacity he built an eighty stamp mill, which was at that time the largest in the world. In 1884 he went to Europe, where he remained for three years lecturing in the Dexter School of Mines. He returned to Arizona in 1887, and there discovered the copper deposits in the Verde country. For many years he carried on litigation with William A. Clark to determine the ownership of stock in the United Verde Copper Company. In November, 1909, the Appellate Division of the Supreme Court of New York reversed a judgment obtained by him against Mr. Clark. He was an officer and director in many important mining companies in the United States and Alaska.

TREATIES. See **UNITED STATES.**

TREATIES, FRANCO-GERMAN. See **MOROCCO, History.**

TRENGGANU. One of the tracts ceded by Siam to Great Britain March 10, 1909. It has an area of about 6000 sq. miles and a population of about 50,000. Capital, Trengganu. The inhabitants are mainly Mohammedans. Sultan (1911), Zainulab-din ibni Marhum Ahmad. British agent, W. D. Scott.

TREVELYAN, G. M. See **LITERATURE, ENGLISH AND AMERICAN, General Biography.**

TRILLEY, JOSEPH. A rear-admiral, retired, of the United States navy, died March 6, 1911. He was born in Ireland in 1838, and entered the naval service as third assistant engineer in 1860. He served throughout the Civil War, rising to the rank of first assistant engineer. In 1871 he was appointed chief engineer. He served at various stations and on various vessels, and attained the rank of commander in 1892. His last active service was at the navy yard at Mare Island, California. In 1892 he attained the rank of captain, and was retired in 1899 with the rank of rear-admiral.

TRINIDAD AND TOBAGO. Islands of the West Indies; a British colony. Trinidad covers 1754 sq. miles, Tobago 114. Total population (census of 1911), 330,093 (in 1901, 273,898). Port of Spain, the capital, has 60,000

nhabitants. The imports amounted in 1910 to \$3,343,011 and the exports to \$3,467,588. The asphalt export was 146,748 tons (£163,815), and the cacao 57,858,640 lbs. Miles of railway in operation, 89. The administration is in the hands of a governor (in 1911, Sir G. R. Le Hunte), aided by executive and legislative councils. See VOLCANOES.

TRINITY COLLEGE. An institution of higher learning at Hartford, Conn., founded in 1823. The number of students enrolled in the various departments of the college in 1910-11 was 232. The faculty numbered 22. There were no notable changes in the faculty during the year. The amount of productive funds of the college was \$1,185,341. The income is about \$70,000 annually. The library contains about 30,000 volumes. The president is F. S. Luther.

TRIPOLI. A vilayet of the Ottoman empire, on the Mediterranean coast of Africa, bounded on the west by Tunis and southern Algeria, on the east by Egypt, on the southeast and south by the Sahara. The area is estimated at 405,400 sq. miles and the population, mostly Berbers, at about one million (inclusive of Bengazi, or Cyrenalca). The capital is the town of Tripoli, with 40,000 inhabitants; capital of Bengazi, Bengazi, with 25,000.

There are no rivers and the rainfall is frequently insufficient; so that a good harvest can be counted on only once in three or four years. Besides metals, manufactured articles, tea, beads, wines and spirits, etc., for home consumption, the imports include articles for barter in Wadai, Bornu, and western Sudan; with which countries Tripoli maintains a caravan trade, which has, however, greatly declined in recent years. The products and exports are ostrich feathers, ivory, skins, sponges, hides, sparto, and domestic animals. The declared imports amounted in 1909 to £437,640 (£467,200 in 1908), and the exports to £172,800 (£169,400 in 1908). The revenue is derived mainly from a poll tax levied according to the wealth of the individual, and from tithes.

The vilayet was administered previous to the Italian occupation in October, 1911, by Bekir Sami Bey as governor-general or *vahi*. Bengazi (or Barca, or Cyrenalca) had a *mutessarif* (1911, Murad Fuad Bey). The city of Tripoli was occupied by Italian forces at 4 P. M. on Thursday, October 5, 1911; Tobruk fell October 10, Derna October 18, Bengazi October 20, Homs October 21. A decree was published in Rome November 5 proclaiming "Tripolitania and Cyrenalca under the full sovereignty of the kingdom of Italy." At the end of the year Italian troops occupied all the coast towns; but the desert, trackless and waterless, was still to conquer. See TURCO-ITALIAN WAR.

TRIPP, BARTLETT. An American public official, former minister to Austria-Hungary, died December 8, 1911. He was born at Harmony, Me., in 1842, and was for three years a student at Waterville College, now Colby University. In his senior year, however, he removed to California. For the four years succeeding he worked as a surveyor, taught school, and studied law in California, Nevada, and Utah. In 1867 he graduated from the Albany Law School. After being admitted to the bar he practiced law for two years at Augusta, Me. He then removed to Yankton, S. D. In 1878 he was a candidate for Congress and was defeated. He

was a delegate in 1883 to the first constitutional convention for the Territory of South Dakota. In 1885 he was appointed chief justice of the Supreme Court of Dakota by President Cleveland, which position he held until the division of the Territory four years later. In 1893 he was appointed United States minister to Austria-Hungary and served in this office for four years. After the expiration of his term he became, in 1899, chairman of the Samoan commission to settle questions among the United States, England, and Germany. From 1902 to the time of his death he was lecturer on constitutional law at the University of South Dakota.

TROIS FRERES, or EAGLE ISLANDS. A dependency of Mauritius (q. v.).

TROPICAL DISEASES. Tetanus is noted in the Philippine Islands as the result of a cure called "fuentq" practiced by the arbolarios or unlicensed physicians on persons suffering from chronic diseases, such as beriberi. It is a common belief among certain classes of people, especially in the provinces, that they are relieved by opening a "fuente" on either the arm, thigh, or leg. A mixture of lime and Chinese soap in the proportion of two to one is made into a "bolita" (pill), the diameter of which varies from .5 to 1 cm. This pill is then placed on the arm or leg and is held in position by a bandage until a blister forms. The next day another "bolita" of the same size, made of garlic, is placed on the surface of the previously opened blister, the wound dressed as before, and the dressing is not removed until pus is produced and a cavity formed. A cavity once created, another "bolita" made of Chinese wax or betel-nut is introduced and covered with a piece of Chinese blotting paper. A hole is made in the middle of the paper and a piece of banana leaf is put on next and loosely bandaged. By pressure the hole becomes so deep that the pill soon has a cavity large enough to hold it. Each part of the dressing has its own purpose. The pill is to maintain pressure on the cavity and prevent healing; the blotting paper absorbs any secretion; the banana leaf protects the wound from becoming wet, and the bandage keeps out the air. The wound is washed morning and afternoon with warm guava water or ordinary tepid water and the dressing changed. It is supposed that the secretion removes the impurity of the blood which has caused the sickness. If the "fuente" fails to cause secretion, the sickness is said to be incurable. If the patient gets well, the "bolita" or "pelotilla" is removed and the wound treated as before until it heals. It is believed that many cases of tetanus originate in this way.

The reports of the Department of Sanitation of the Isthmian Canal Commission indicates that the canal zone, formerly infested by disease and pestilence, is as safe a place as any on earth for a white man or woman to live in. During the month of March there were only 43 deaths from all causes among 47,935 employees. Sixteen of these deaths were from violence, and 27 were from disease. Of these victims, 23 were colored, and 4 were Italian or Spanish. Not a single white American man died of disease. Still more striking are the figures for white employees and their families from the United States. In this class there are at present 10,299 persons in the canal zone. Out of

this number, there were only 10 deaths during the month. Of these, 3 white employees from the United States, out of a total number of 6017, died as the result of accident—none died as the result of disease. Of 7 white employees who died in October, only one was an American—a man aged 44, who died of chronic nephritis. The only other death among white Americans in the canal zone during this month was that of a child who died of peritonitis. Nearly 12,000 white men, women, and children from the United States (11,839) are living comfortably and safely in what was a few years ago a hot-bed of disease, and the annual death rate among them, as indicated by the deaths for October, was 2.03 per thousand.

VERRUCA PERUANA, syn. *verruca peruviana* and *fièvre de la Oroya*, or Carrion's fever, derives its eponymic appellation from Daniel Carrion, a young Peruvian, who lost his life in attempting to determine the infective nature of the disease. The malady has a particular interest for Americans outside of those who work in Peru, because many become infected in Peru and return to the United States, bringing the infection with them. *Verruca peruana* is a very serious and frequently fatal disorder, characterized by fever of irregular type and severe anemia, followed by a wart-like eruption of the skin, or mucous or serous membranes. The mortality was so great during the construction of the Oroya Railroad, which extends from Lima to the Cerro de Pasco mines, that one of the large bridges crossing the river is known generally as Verruca Bridge. Peruvian physicians believe that only by sleeping in an infected district or passing through it at night can the disease be contracted, and it is generally held that it is transmitted by the bite of an insect. Formerly the disease had a much wider distribution than now. It is encountered in certain narrow valleys of the Peruvian Andes between 8 and 13° south latitude, and at altitudes of from 1000 to 12,000 feet. It is distributed along narrow tributaries, which drain into rivers flowing into the Pacific Ocean. The disease is never contracted in the lower coastal plain but always in the valleys at the higher altitudes, not less than 16 to 36 English miles from the sea. It does not cross the divide, and is unknown on the eastern face of the Andes. Two varieties of the fever are recognized—a malignant form known as Oroya fever, which is characterized by irregular temperature, blood changes like those of severe anemia, vertigo, restlessness and air hunger, followed by a warty eruption, and a high mortality; and the benign form, in which the symptoms are more undefined, and the patients usually follow their vocations; the anemia and fever are moderate and the eruption is of a nodular type and lasts longer than in the malignant forms, but disappears by involution or ulceration in from four to six months. The mortality of the malignant form is from 85 to 90 per cent. There is no natural immunity to the disease of any kind—race, age, or sex. Infants have been born vocations, the anemia and fever are moderate infected with the disease. See also **BERBERI**, **MALTA FEVER**, **PELLAGRA**, **PLAGUE**, and **SLEEPING SICKNESS**.

TRUST COMPANIES. See **LOAN AND TRUST COMPANIES**.

TRUSTS. One of the foremost public questions of the year was the trust problem. The year opened with the argument of the Standard Oil case before the Supreme Court of the United States; this was followed by the Tobacco Trust case; then in May came the momentous decisions in those suits. There followed reports by the Commissioner of Corporations on the Steel and Tobacco combinations, hearings before House committees authorized to investigate the Steel and Sugar trusts, and before the Senate committee on interstate commerce, authorized to inquire into the whole subject. Meanwhile there were many prosecutions being carried on by national and State departments of justice. The public press was devoting much space to the discussion of the problem; President Taft discussed it in many speeches and devoted a message to Congress to it in December; Mr. George W. Perkins, formerly with J. P. Morgan & Co., in various addresses and articles, Mr. Roosevelt through the *Outlook*, Congressman Littleton of New York, in a notable address at Pittsburgh, and many others were advancing the principle of regulation as superior to attempted destruction; and the National Civic Federation was making an extensive inquiry into opinion among all classes of citizens.

In addition to the matter below see **STANDARD OIL, AMERICAN TOBACCO COMPANY, UNITED STATES STEEL CORPORATION**.

RULE OF REASON. The most discussed parts of the decisions of the Supreme Court in the Standard Oil and Tobacco cases were those in which the court stated and reiterated its conviction that this law should be given a reasonable interpretation. This was looked upon by the country as virtually a new interpretation of the law. Justice Harlan, though agreeing with the other members of the court in denouncing the combinations, most vigorously dissented from the view expressed by the "rule of reason." He held that this really amounted to an amendment to the law, whereby it was made to apply only to unreasonable combinations in restraint of trade. In a separate opinion of 15 pages he most bitterly denounced that practice of American courts whereby they make new laws by reading into old ones unexpected interpretations. He even declared that this practice of judge-made law "would in the long run prove disastrous for our political system," and would "in the end prove most dangerous to all." With this view a large proportion of the American public strongly sympathized. Very often has public opinion been called upon to condemn the practice of amending constitutions and legislative enactments by means of judicial construction.

It was undoubtedly true that this interpretation of the law was unexpected. Mr. Justice Lacombe, in the majority opinion of the Circuit Court on the Tobacco case in 1908, had held that the law applied to every contract, however small. He said, "Two individuals who have been driving rival express wagons between villages in two contiguous States who enter into a combination to join forces and form a single line have restrained existing competition." Mr. Peckham, in the *Trans-Missouri Freight Association* and *Joint Traffic Association* cases of 1897 and 1898 said, in speaking of the meaning of the act: "The plain and ordinary meaning of such language is not limited to that kind of control

alone, which is in *unreasonable* restraint of trade, but all contracts are included in such language, and no exception or limitation can be added without placing in the act that which has been omitted by Congress." On the other hand, the late Justice Brewer, in the Northern Securities case, said: "Congress did not intend to reach and destroy those minor contracts in partial restraint of trade which the long course of decisions at common law has affirmed were reasonable and ought to be upheld. The purpose rather was to place a statutory prohibition upon those contracts which were in direct restraint of trade, unreasonable, and against public policy." Indeed, even in the Joint Traffic case, already mentioned, this clause is found: "The act of Congress must have a reasonable construction, or else there would scarcely be an agreement or contract among business men that could not be said to have, indirectly or remotely, some bearing on interstate commerce, and possibly to restrain it." It thus appeared that the view of reasonableness in interpretation taken by the court in these decisions was at least foreshadowed in earlier cases. The Chief Justice in the Tobacco Trust decision strongly reinforced the view taken in the Standard Oil case. He held that the application of the rule of reason to the interpretation of the words "restraint of trade" would make it include those contracts or agreements or combinations included by this same phrase at common law and in the law of the country at the time of the adoption of the anti-trust act; that is, it would include only such acts or contracts as are prejudicial to public interests by unduly restraining competition or injuriously restraining trade. The Chief Justice went so far as to say, "Indeed, the necessity for not departing in this case from the standard of the rule of reason which is universal in its application is so plainly required in order to give effect to the remedial purposes which the act under consideration contemplates, and to prevent that act from destroying all liberty of contract and all substantial right to trade, and thus causing the act to be at war with itself by annihilating the fundamental right of freedom to trade which, on the very face of the act, it was enacted to preserve." He held that this interpretation would prove more effective and more comprehensive than strict adherence to the letter of the law.

As to the effect of such interpretation opinion was hopelessly divided. Some pointed out that to apply the law rigorously to all restraints would make the statute ridiculous, whereas to apply it only to those restraints which the common law condemns as unreasonable because they interfere with business and promote monopoly and are, therefore, contrary to sound public policy, makes the law rational and useful in promoting the sound industrial development of the country. On the contrary, a considerable body of opinion held that the practical insertion of the word "unreasonable" in the law made it ineffective. Some years ago, when it was proposed to insert this word in the Sherman law the Senate judiciary committee unanimously disapproved on the ground that "it would render the act indefinite and uncertain, and hence, to that extent, utterly nugatory and void." Similarly President Taft, in his special message of January, 1910, had said that the proposal to make the law apply only to unreasonable re-

straints of trade "would put into the hands of the court a power impossible to exercise on any consistent principles which will insure the uniformity of decision essential to just judgment. It is to thrust upon the courts a burden that they have no precedents to enable them to carry, and to give them a power approaching the arbitrary, the abuse of which might involve our whole judicial system in disaster."

The immediate effect of the Supreme Court decisions was a feeling of optimism shown by a pronounced upward movement on the stock exchanges. Nevertheless, it soon became evident that the business men of the country were not entirely satisfied with the interpretation of the Sherman law. They felt that this very "rule of reason" made the interpretation of the act in any particular case uncertain. This feeling of uncertainty as to the legality of pools and minor trade agreements was so general that no real revival of business followed these decisions. It was felt that either a considerable number of decisions under this new view would be necessary to define the limits of reasonable restraints of competition or that Congress must at once take up the matter of the most feasible plan for regulating combinations of capital.

PROPOSED SOLUTIONS OF THE TRUST PROBLEM. Both before and after the decisions of the Supreme Court under the Sherman act numerous proposals were made for the solution of the trust problem. These ranged all the way from a proposal to insert in the Sherman law a clause making it applicable to all restraints, whether reasonable or unreasonable, to that advanced by Judge Gary before the Stanley committee (See **UNITED STATES STEEL CORPORATION**) whereby a governmental authority would be established having power even to fix prices. Two things seemed manifest: one, that the violent hostility to big business, so evident a few years ago, was subsiding, though in the West some strong opposition was still shown; the other, that greater favor for the idea of regulating, rather than destroying, the trusts was being more and more widely accepted.

The various attitudes toward the trust problem may be classified under three headings. In the first place there is the *laissez-faire* view. This represents the time-honored view of the individualistic philosophy, which maintains that in a condition of free competition, of struggle of each against all, progress will be most rapid and general welfare will be greatest. This view, however, has gradually lost ground in every aspect of the relation of government to business, and is now held by only a small and dwindling minority as regards the corporation problem.

In the second place, there are those who favor the annihilation of trusts. This is the idea expressed by that interpretation of the Sherman act which makes it destructive of all combination; it is the plan favored by Mr. William J. Bryan and by Senator Cummins of Iowa. They would crush every tendency toward the elimination of competition, by limiting the amount of business, or by limiting the proportion of a business which any one concern may have; they would even limit the amount of capital. One of the chief objections to this plan is that it makes mere size criminal. Another is that it is reactionary in character, in that it fails to recognize the world-wide tendency toward combination and consolidation, of which it

overlooks the undoubted economic advantages. It would push industry back to "competition and a free market." This was the most widely accepted view in this country only a few years ago, and it is still widely favored in States west of the Mississippi and on the Pacific coast.

In the third place, there is the plan of regulation. This proposal first points out the advantages of large scale production and the economies due to combination. It finds that there is a world-wide tendency toward large business units on account of these advantages. It would preserve these business economies, but take measures to stamp out the evils inherent in monopoly power. This means that the government must so supervise monopolistic business as to force it to share its advantages with the consuming public. This may be done in large part by publicity secured by means of a well-organized corps of inspectors, as in the case of banks. Or, it may require the organization of a commission with much discretionary power, even to the extent of power to fix prices, as in the case of the public service commissions or the Interstate Commerce Commission. This latter view in one form or another was that to which President Taft showed increasing favor; it was advocated by ex-President Roosevelt in the *Outlook* and elsewhere; it was favored by Chairman Gary, of the Steel Corporation, and it was on numerous occasions effectively presented by Mr. George W. Perkins; it was widely favored by the press, by business men, and by economists.

There thus developed a divergence of view as to the advisability of retaining or amending the Sherman act. President Taft and Attorney-General Wickersham both felt the obligation as public officials to enforce that act so long as it was the law of the land; and after the Supreme Court decisions of May they thought the act should stand unmodified as expressing with sufficient clearness the negative rules for the guidance of business promoters. This view was not widely shared. Secretary Nagel, of the cabinet, said that organizers of a corporation could not ascertain whether they would be liable to prosecution or not; and Interstate Commerce Commissioner Prouty said that no lawyer could advise with certainty whether a given trade agreement was within or without the inhibition of the statute. In other words, the belief was well-nigh universal that business uncertainty would only be dispelled by the formulation of a positive set of rules or the organization of an administrative body to regulate the organization of large concerns. The President finally accepted this view. Whether these concerns should be merely licensed by the national authorities, or should incorporate directly under federal law, thus became, by the close of the year, subordinate to the question of forming an interstate trade commission. Similarly subordinate became the question of repeal of the Sherman act, for, its inadequacy being granted, its fate became dependent on the solution of the larger question of trust regulation by an administrative board.

PRESIDENT TAFT'S VIEW. After the decisions of the Supreme Court in the Standard Oil and Tobacco cases, President Taft expressed great satisfaction with them. He thought that they made the meaning of the Sherman law sufficiently clear, especially when taken in connection with other decisions. In view, however, of the great attention given to this problem in the country

during the summer and fall he decided to devote his entire annual message to the question of trust control. In this message he reviewed the judicial interpretations of the Sherman act, again explaining his conviction that the meaning of that law was sufficiently clear to enable business to reorganize, when necessary, without great disturbance. He expressed his disagreement with those who declared the disintegration of the oil and tobacco combinations to be a mere change of garments without any change in real control. He showed that the law, as interpreted, does not prohibit mere bigness, but rather the elimination of competition. He held that when a combination has the effect of suppressing competition, the promoters should not complain if the court holds that they intended to accomplish what they did accomplish, "for men do not do such things without having it clearly in mind." It should be noted, however, that business men generally dissented from this view on the ground that suppression of competition may be incidental to the achievement of other ends, expressly aimed at.

President Taft then went on to advocate laws which should describe those methods and practices deemed unfair. He recalled his recommendation made in January, 1910, for federal incorporation of companies doing an interstate business. He pointed out that the Bureau of Corporations was of great service to the Circuit Court in the formulation of the dissolution plans in the tobacco case, and thought advisable a law making this bureau, or some similar one, an executive commission to supervise interstate corporations. The law, in his view, might set forth rigid rules for organization and procedure, including effective publicity; and the proposed commission would supervise security issues, act as an advisory board for promoters in doubt as to the legality of their plans, and aid the courts in the dissolution and reorganization of illegal combinations.

INVESTIGATIONS. As in years past the Bureau of Corporations continued its inquiries into various combinations, including the Steel, Sugar, Lumber, and Tobacco trusts. Some of its results were published and are summarized under **AMERICAN TOBACCO COMPANY AND UNITED STATES STEEL CORPORATION**. In addition there were congressional investigations of the Steel and Sugar trusts. At the very last of December the Democrats in the House had agreed to authorize investigations into the Harvester and Shipping combines, and the so-called Money trust. Regarding this latter the following charges were made: That a half dozen Wall Street financiers dominate the money market, make and unmake panics, control railroads, the Harvester and Steel combines, international shipping, and insurance companies, and manipulate a chain of banks; that the present system of money, exchange, and credit entails enormous losses through speculation, gambling, and manipulation not necessarily incident to the natural course of trade; and that these practices are directed through well-defined centres, the greatest of which is alleged now actually to have the power of controlling credit and exchanges so as to produce business depression.

PROSECUTIONS: ELECTRIC LAMP TRUST. Late in December, 1910, the government had announced a suit against the combined manufacturers of electric lights. The defendants in-

cluded the General Electric Company and 35 affiliated and subsidiary companies controlling about 97 per cent. of the manufacture and sale of carbon filament, or incandescent, electric lamps. Some 80,000,000 of these lamps are sold annually. The evidence in this case was not submitted, for, shortly after the decisions of the Supreme Court in the Oil and Tobacco cases, the defendants pleaded guilty. The decree of the Circuit Court at Toledo, O., ordered the dissolution of the National Lamp Company and all subsidiaries; and forbade the General Electric Company to do business in the manufacture or sale of electric lamps except in its own name. One of the charges against this combination was that it used its control of patent rights to dictate the prices of its product to jobbers, wholesalers, and retailers. Moreover, by means of contracts with jobbers and dealers, due to power based on its patent rights, it had maintained a monopoly over lamps, the patents on which had expired. The court ordered these monopolistic price-fixing devices terminated and enjoined all the companies from entering into price-fixing agreements with each other or with independent concerns.

BATHTUB TRUST. In July, 1910, the government brought suit in the United States Circuit Court at Baltimore to secure an injunction restraining the Standard Sanitary Manufacturing Company and 15 other concerns and 32 officers, comprising the so-called Bathtub trust, from maintaining a price-fixing agreement. The evidence showed that this combination controlled about 85 per cent. of the business of the sanitary enameled ironware. Their control of production was based primarily on the control of a tool used in spreading the enamel upon the iron base of the article being made; they had forced numerous jobbers to sign trade agreements to handle only the combination's products. The court held that the ownership of a tool gave no monopoly right over the articles produced by it. In a very sweeping decree, the court ordered the dissolution of the combination.

In December, 1910, criminal suit was begun at Detroit against these same concerns and individuals on the same charges. Various demurrers and dilatory pleas were presented by defendants and overruled before the case came to argument late in 1911. Decision had not been rendered at the end of the year.

SUGAR TRUST. Following an investigation begun late in 1909 and completed in May, 1910, a suit in equity was filed at New York in November, 1910, against the American Sugar Refining Company, its officers, agents, and subsidiary companies as a combination in violation of the Sherman act. This case was not vigorously advanced by Attorney-General Wickersham, owing to the important bearing upon it of the decisions of the Supreme Court in the Standard Oil and Tobacco cases. Following those decisions, however, the case was again taken up and was being pushed forward at the end of the year. Meanwhile the House of Representatives, partly as a means of furthering that suit, authorized a committee to hold hearings on the history, organization, and methods of the combination. Representative Hardwick was made chairman. Hearings were held at Washington in August, and a great deal of rather well-known history was reviewed.

The suit against Mr. George R. Heike, former secretary of the American Sugar Refining Com-

pany, which grew out of the underweighing frauds, first discovered in 1907, and which had led to his conviction along with that of the superintendent of the Williamsburg Refinery, was carried to the United States Circuit Court of Appeals. This court in October affirmed the conviction of Heike, who then announced that his case would be appealed to the United States Supreme Court. During the investigation of the weighing frauds illegality was discovered in the draw-backs given to the American Sugar Refining Company on account of exported syrups. It was found that great quantities of these syrups, upon which the company had claimed and received draw-backs, were, in fact, manufactured out of free, rather than dutiable, sugar. The government claims were settled by the payment of \$700,000 by the company. This was entirely separate from the \$2,600,000 which the company paid the government on account of the underweight frauds. It was asserted that similar draw-back frauds had been discovered at New Orleans and San Francisco.

Another important suit involving this company was that growing out of the suppression of the Pennsylvania Sugar Refining Company in 1903-04. Trial had been set for the November term of the criminal branch of the United States Circuit Court at New York, but owing to the occupation of the attorneys for the defendants in formulating a plan for the disintegration of the Tobacco trust, trial was postponed to January, 1912. The two principal defendants were Washington R. Thomas, former president of the American Sugar Refining Company, and John E. Parsons, a director and former counsel of the company.

On October 11 hearings were begun in the Chancery Court at Newark, N. J., in the suit of one Nathaniel Cooper, against the National Sugar Refining Company and the heirs of Henry O. Havemeyer, to compel the forfeiture of \$10,000,000 worth of common stock in that company, alleged to have been issued to Mr. Havemeyer without due return, in 1911. This suit involved an enormous mass of testimony and enlisted the services of 25 lawyers for the defense, but had little interest for the general public, except in so far as it indicated the autocratic power of the former ruler of the Sugar trust.

BEEF TRUST. Two different suits have been carried on against the Chicago meat packers. One of these was a civil suit against the National Packing Company and others, begun March 21, 1910. This suit was dismissed by order of the United States Attorney-General in December, 1910, in order to facilitate the prosecution of the other suit. This second suit was a criminal suit, begun in September, 1910, against the ten principal owners of the Swift, Armour, and Morris packing companies. They were charged with maintaining an unlawful conspiracy in restraint of interstate commerce in cattle, sheep, and hogs, and in the sale of fresh meats. The indictment called attention to their numerous branch houses and laid stress on the existence of the National Packing Company as a central agency of the combination. The attorneys for the packers exhausted every device for delaying the prosecution of the trial, carrying various motions for the dismissal or stay of proceedings to the Circuit Court and even to the United States Supreme Court. Neverthe-

less, trial was actually begun in the District Court at Chicago in December.

The jury was finally selected December 19. In his opening statement United States District Attorney James H. Wilkinson stated that the defendants had, by means of the National Packing Company, maintained the old pooling practices of the packers and had really effected a most complete suppression of competition. He laid stress on the following points: That the combination maintained by the ten packers under indictment was so skillfully devised that subordinates in various companies thought that competition really existed; that defendants and their predecessors had dominated the meat industry since 1880; that the key to their system of price control has been the uniform method used by the members of the combination in figuring the "test cost" of product; that the prices thus resulting gave the members exorbitant profits; that the system devised under the old pooling agreements whereby the country was divided into sections and each member given a certain percentage of business in each section was still in existence; that forfeits are paid to members failing to get their proportion of business in different sections, such being provided by fines levied on those members getting more than their share; that formerly the representatives of the combination met weekly in Chicago to fix prices; that since the formation of the National Packing Company its directors have fixed prices periodically, using a specially devised trade code; that rate wars were instituted to drive out competitors; and that other competitors were absorbed, notably the Schwarzschild & Sulzberger Company, and the New York Butchers' Dressed Meat Company.

The defense contended that facts prior to three years before the indictment, or prior to 1907, should be excluded; that the National Packing Company was not organized to fix prices or control the trade; that the weekly meetings prior to 1903 were for the sole purpose of preventing the overstocking of the market with fresh meat; that the defendants had more than 300 competitors, who transacted 30 per cent. of the domestic meat trade. On December 26 a plea of immunity was entered in behalf of three of the defendants on the ground that they had furnished evidence in 1905 to the Commissioner of Corporations. On the same day the government read to the jury a contract whereby the defendants had sought in 1902 to form a \$500,000,000 merger of meat-packing interests. Further testimony showed that this attempt followed an effort of the preceding year to form a combination with a capital of about \$900,000,000; this was disclosed by an agreement read by government counsel and signed by members of the Armour, Swift, Morris, and Cudahy firms. Evidence was then submitted showing that the National Packing Company was formed in 1903 with a capitalization of \$15,000,000, by the merging of 13 companies, all of which had previously been purchased by the big packers. Of these companies the G. H. Hammond & Company, the St. Louis Dressed Beef Company, the Hammond Packing Company, the Omaha Packing Company, the United Dressed Beef Company, and the Anglo-American Provision Company were the largest.

POWDER TRUST. Suit had been begun against the E. I. DuPont de Nemours Powder Com-

pany and 27 other corporations known as the Powder trust in 1907. After prolonged investigation and argument, the United States Circuit Court at Wilmington, Del., in June, 1911, Judges Gray, Buffington, and Lanning presiding, declared the defendants guilty of maintaining an unlawful monopoly in the manufacture and sale of powder and other explosives. Indictments against 14 other corporations and United States Senator DuPont were dismissed. The combination was ordered to dissolve. In the course of its opinion the court held that a restraint of competition is not necessarily a restraint of interstate trade and commerce. The court said, "The determination of whether it be so must depend upon the facts and circumstances of each individual case. It is undoubtedly the policy of the statute that competitive conditions in interstate trade should be maintained wherever their abolition would tend to suppress or diminish such trade. But this, being true, does not read into the statute a denunciation of all agreements that may restrain competition without regard to their purpose or direct effect to restrain trade or commerce among the several States." This distinction, based on the Supreme Court rulings in the Oil and Tobacco cases, was deemed of great significance in the evolution of judicial interpretation of the Sherman act.

STEEL WIRE TRUST. About July 1, 83 men, officers in various wire manufacturing companies, were indicted by the federal grand jury in New York for violation of the Sherman act, through the maintenance of nine pooling agreements. These men were officers in the American Steel and Wire Company, and 36 other corporations or partnerships. The nine pooling associations involved with the percentage of their respective industries, which each controlled, were as follows: Fine Wire Magnet, 85; Underground Power Cable, 95; Horseshoe Manufacturers, 70; Bare Copper Wire, 95; Telephone Cable, 80; Rubber Covered Wire, 80; Lead Encased Cable, 80; Wire Rope, 80; Weatherproof and Magnet Wire, 90. Though the defendants claimed that the pools were dissolved at various times in 1908-09-10, they entered pleas of *nolo contendere*, and were punished by fines of about \$1000 each; the organizer of the pools, E. E. Jackson, was fined \$45,000. The total of fines paid up to November 1, 1911, was \$128,720.

SOUTHERN PACIFIC COMPANY. Civil suit was begun February, 1908, in the United States Circuit Court in Utah charging the Southern Pacific Company and the Union Pacific Railway Company with being a combination and conspiracy in violation of the Sherman act. On June 23, 1911, the court rendered a decision dismissing the suit on the ground that the roads involved were not competing lines and hence their combination was not a violation of law. Judge Cook dissented from the decision. The government appealed to the United States Supreme Court, before which the case was set for argument in January, 1912.

WATCH TRUST. On December 20 the government began suit in the United States Circuit Court at Philadelphia against the Keystone Watch Case Company, and its officers, charged with conspiracy and attempt to monopolize the manufacture and sale of watch cases in the United States. The government's petition gave the history of the company. It pointed out that

the watch industry in the United States is divided into two parts, watch case and watch movement. It charged that the defendants manufactured and sold 80 per cent. of all watch cases produced in the United States. It alleged that the Keystone Watch Case Company, by various reorganizations and purchases, had consolidated with itself or obtained control over the Riverside Watch Case Company, the New York Standard Watch Company, the United States Watch Company, the E. Howard Clock (afterwards Watch) Company, the Crescent Watch Case Company (which had a controlling interest in the American Waltham Watch Company), the Bay State Watch Case Company, the American Watch Case Company of Toronto, Ltd., and the latter's sales agent, the Keystone Crescent Watch Case Company of Canada, Ltd. Moreover, the government charged that in 1904 the Keystone Company had by contract become the exclusive agent in charge of the export trade of the Elgin Company, except in Canada; and that in 1909 a similar contract was made with the Waltham Watch Company, except as to the trade with Great Britain, France, and Spain. The defendants were charged with forcing jobbers and dealers to handle only their goods at prices fixed by them, maintaining black lists for this purpose. They were also charged with threatening independent companies with destruction should they refuse to sell out to the combination. The government charged that defendants had asserted that "they would spend a million dollars, if necessary, to drive some of the larger competitors out of business, and that they would hang crepe on the doors of such competitors' factories."

ANTHRACITE COAL COMBINATION. In June, 1907, suit was begun in the Circuit Court for the Eastern District of Pennsylvania against the Reading and five other anthracite coal carrying roads for maintaining a conspiracy to control the production and distribution of anthracite coal. The charges in this suit in addition to this general charge of conspiracy declared the purchase of the Susquehanna and Western Railroad by the Erie Railroad, and the purchase of the Jersey Central by the Reading Company to be in restraint of trade; that the more than 40 agreements whereby these roads contracted to pay the independent collieries along their lines 65 per cent. of the tide-water price of coal were restrictions of trade; and that the organization of the Temple Iron Company, whose stock was owned by the defendant roads, had prevented the building of another tide-water railroad, and was, therefore, a restraint of commerce. On December 8, 1910, the Circuit Court rendered a decision favorable to the defendants, except that the Temple Iron Company was enjoined from further preventing the construction of a road by independent mine operators. Justice Buffington, moreover, dissenting from his two associates, held the 65 per cent. contracts to be illegal. Both sides appealed to the United States Supreme Court, before which the case was argued in October. Both sides set forth the history of the case and the various transactions involved, endeavoring to so interpret the conditions as to substantiate their respective claims. Decision had not been rendered at the close of the year.

LUMBER TRUST. Following a comprehensive investigation into the organization and conduct

of the lumber business, four suits in equity and one criminal suit were initiated. In May the Eastern States Lumber Dealers' Association, its officers, and members, were charged with conspiracy in restraint of trade through the use of black lists and trade agreements. In August suit was begun at Detroit against Edward E. Hartwick and others, conspiracy and unlawful restraint of trade being alleged. In September civil suit was begun at Denver against the Colorado and Wyoming Lumber Dealers' Association, and the Lumber Secretary's Bureau of Information, conspiracy in restraint of trade in lumber and its products being charged. The government sought an injunction restraining the bureau from circulating black lists and enjoining the association from supporting the bureau. In October similar suit was begun at St. Paul against the Lumber Secretary's Bureau of Information and other companies and individuals on a similar charge. The criminal suit was begun in June in the northern district of Illinois against the secretary of fourteen retail lumber associations, covering twenty-three States, from Pennsylvania to the Pacific coast. They were charged with conspiracy by maintaining a central bureau for the control of the sale of lumber; it was alleged that they kept black lists of wholesale dealers who violated a rule forbidding direct sale to consumers.

TRANS-ATLANTIC STEAMSHIP POOL. A petition in equity was filed at New York City on January 4 against the Hamburg-American Packet Company and other steamship lines as maintaining a combination to control traffic on the Atlantic Ocean. Various delays were interposed to the prosecution of the suit, which had not been argued at the end of the year.

MAGAZINE TRUST. In June suit was begun in New York against a large number of publishers of magazines, charging them with having formed an illegal combination by means of the Periodical Publishing Company, or the Periodical Clearing House. The object of this company was said to be the control of the prices at which various magazines should be re-sold to local agents and ultimate consumers. Among the defendants were Harper & Bros., the Ridgeway Company, the S. S. McClure Company, the Butterick Publishing Company, and the Review of Reviews Company. The government contended that the object of the association was to prevent competition on subscription rates. The defendants declared that their purpose was merely to maintain subscription agencies. They declared that they had asked the government for an opinion as to the legality of the association and that the Department of Justice, after examining all papers and plans, gave assurance that there was no violation of the law.

SHOE MACHINERY TRUST. Following various investigations by both State and national authorities, the grand jury at Boston brought in an indictment in September against S. W. Winslow and other members of the United States Machinery Company, charging them with illegal combination and monopoly in shoe machinery. This case aroused the greatest interest throughout the boot and shoe industry because of the close control which the United Shoe Machinery Company has maintained over machinery used in this industry by means of its leasing system. This system prevents manufacturers from gaining title to machines, all such being leased on

a royalty basis. Moreover, the power thus acquired over manufacturers, it is alleged, has been used to prevent the introduction of any machinery made by rival concerns.

OTHER PROSECUTIONS. Among the various other prosecutions under the Sherman act, the following may be mentioned: The cotton corner case, wherein certain cotton brokers were charged with a conspiracy to monopolize the trade in raw cotton, was not much advanced through the year. Certain demurrers, which were sustained by the Circuit Court, were appealed by the government to the Supreme Court, whose decision had not been rendered at the end of the year. The Night-Rider cases, which had been appealed to the Circuit Court of Appeals in the Sixth Circuit, had been argued, but decision had not been rendered. The suit against the Great Lakes Towing Company and others at Cleveland as constituting a monopoly of the towing of vessels on the Great Lakes, was being advanced; a vast amount of testimony had been taken and the case was nearly ready for argument. The members of the Southern Wholesale Grocers' Association, charged with an attempt to control the trade in groceries and other necessities in the Southern States, voluntarily accepted the terms of a comprehensive injunction restraining them from the acts complained of. This was issued by the Circuit Court at Birmingham in October. Suits against the so-called Milk Trust at Boston, a wall paper combination at Cleveland, the Standard Wood Company and others (the kindling wood trust), at New York, the Elevator Trust in Oklahoma, were still pending. The suit against the American Naval Stores Company, in which two individual defendants were sentenced to three months' imprisonment, was taken to the Supreme Court by a writ of certiorari. Suit was also begun in August at Columbus, O., against the Lake Shore and five other railroads by reason of agreements relating to the mining, transportation, and sale of coal. Suits for the dissolution of the Chicago Butter and Egg Board, and against the so-called Brick trust at Chicago were pending at the close of the year.

TRUSTS IN EUROPE. The extended discussion given to the trust problem called out some investigation of how the problem of industrial combination was being treated in European countries. Inquiry showed that in England, Germany, and France combination is looked upon as an inevitable and indeed desirable tendency in industrial evolution; and that, owing to its advantages in giving stability to industry and prices and in increasing power in international competition, it should be at least given a reasonable legal status.

ENGLAND. In England there is no law and no agitation for the enactment of a law similar to the Sherman act. Indeed, the legal situation is very different in view of an interpretation of the common law doctrine of restraint of trade made in 1894 by the House of Lords. Following the consolidation of the two principal concerns engaged in the manufacture of guns and ammunition, the charge was made that this transaction was made in restraint of trade. The House of Lords, however, took the view that the interpretation of these words must be made in the light of present industrial and social conditions. It pointed out that science and invention had almost

annihilated space and time, "and that consequently there should no longer exist any cast-iron rule making void any agreement not to carry on trade anywhere."

In the absence of a protective tariff behind which a combination may build up an oppressive control, the English combinations have generally been limited to securing the inherent economies due to the elimination of competitive wastes and the realization of certain advantages of large scale production. In a few instances combinations that have sought primarily a monopolization of trade have been prevented from using their power by a vigorous assertion of public opinion.

GERMANY. In Germany the law not only does not forbid contracts for the control of a trade or the pooling of a business or industry but actually encourages them. The result is that there are nearly four hundred cartels or federations similar to American trusts; there are twelve thousand establishments reported as belonging to syndicates. The government even goes so far as sometimes to become a party to a trade agreement. The German cartel, however, is not the closely consolidated, secret, and presumably permanent organization that the usual American trust is; but it is as a rule open to any concern submitting to the federation agreement. Such agreements, moreover, may be for a brief period to try their value; members are left practically free in the management of their internal affairs and in the control of their own share of the business. These federations are an expression of a coöperative spirit of the German people and represent a rational attempt to increase the stability and security of trade and to increase competitive power in the world's markets.

FRANCE. In France also there has been a wide development of federations or groupings of concerns in the same line; these have been formed openly and had even gone to the extent of admitting German rivals, thus insuring uniformity of prices in foreign markets.

CANADA. A considerable number of writers during the year called attention to the solution of the trust problem in Canada, under the act of 1910. Under this act six persons may secure an inquiry by making application to a court in writing setting forth specifically the abuses complained of. If the judge is satisfied that there are plausible grounds for complaint he transmits an order to the minister of labor, who proceeds to organize an impartial board of inquiry. This board is composed of one representative from each side and a third chosen by these two or appointed by the minister of labor. The entire expense of all steps is borne by the government. The board is given ample power to get all existing evidence. Its findings are published in the public press. If abuses and evils are found to exist six remedies are offered: (1) Pressure of an informed public opinion; (2) removal of tariff advantages, if any; (3) revocation of patent rights; (4) a fine of \$1000 per day and criminal liability if the combination ignores the findings of the board of inquiry; (5) cancellation of licenses; and (6) withdrawal of subsidies. It thus appears that the Canadian act not only deems combination legal but also natural and inevitable. It aims to preserve a fair price instead of competition; to make the monopolist

share his profits with others, monopoly being looked upon as natural and desirable in some industries. It has the merit also of providing a remedy suited to the conditions of each case; a few cases that have thus far arisen under this act for the investigation of combinations, monopolies, and trusts have been settled speedily and with almost no disturbance of industrial conditions. At the very close of the year the Borden ministry announced that it was preparing a measure for further trust regulation. This would not be a punitive measure, as is the Sherman act, but one providing for a national commission to regulate the organization, capitalization, and methods of combinations.

TSCHUDI, Hugo von. A German art director, died November 24, 1911. He was born in 1841 in Lower Austria. He received his education at the Gymnasium of St. Gall, in Switzerland, and the University of Vienna. The early part of his life was spent in traveling in Italy, France, England, and other countries. He then became a volunteer assistant in the Austrian Museum of Art Industry in Vienna. He was later appointed to the post of assistant director in the picture gallery and in the department of Christian statuary in the Royal Museum in Berlin. In 1896 he became director of the National Gallery of Berlin. Here he remained until he was appointed director of the National Gallery of Bavaria at Munich. He was the author of several works on Italian classical art and coöperated with Prof. Wilhelm Bode in compiling a catalogue of the Statuary of the Christian Epoch. He also wrote on *Painting of the Older Dutch School*, and published a monograph on *Modern Art*, especially dealing with Menzel, Böcklin, and Manet for the *Catalogue of the German Centennial Exhibition* in 1906.

TSETSE FLY. See ENTOMOLOGY.

TUBERCULOSIS. The new edition of the *Tuberculosis Directory*, issued by the National Association for the Study and Prevention of Tuberculosis, covers every phase of the situation with regard to the fight against this scourge. It shows that over 600 cities and towns of the United States and about 100 in Canada were making active efforts for the suppression of consumption, and that on April 1, 1911, there were nearly 1500 different agencies at work for the reduction of tuberculosis—an increase of nearly 700 per cent. in the last seven years. There were 421 sanatoriums, hospitals, and day camps, 511 associations and committees engaged in prevention, 342 special dispensaries, 68 open-air schools, and 98 hospitals for the insane and penitentiaries which made special provisions for tuberculous inmates. The book also contains a summary of the anti-tuberculosis legislation in every State, and the municipal ordinances of about 250 cities.

Next to the United States, Germany was probably most active in the campaign against the spread of tuberculosis. According to the report of the German Central Committee, there were 99 public and 34 private sanatoriums for adult consumptives, in all about 1400 beds. Children are received in 22 institutions, with 1000 beds. There are 86 institutes, with 8122 beds, for children affected with scrofulous affections and those threatened with tuberculosis. Ninety-nine forest convalescent stations were opened during the summer months. Recently following the experience of America, such mildly

affected patients as were able to work during the day were received in out-door camps for the night only. They were provided with a nourishing supper and breakfast. In addition to these agencies, there were fifteen open-air schools and two farm colonies; and thirty-four observation stations were established.

The question as to the risk from tuberculous milk was again actively debated. Hess followed up seventeen cases of children who had been fed on infected milk for longer or shorter periods. In selecting his cases, he first proved that the milk involved contained tubercle bacilli and second that the children had been fed on it habitually. These children were all under five years old. With considerable difficulty Hess kept these seventeen children under observation for three years, examining them all every three months. In only one instance did clinical tuberculosis develop, although several of the children reacted positively to tuberculin inoculation. The child developing the disease had been fed on milk containing virulent tubercle bacilli, and had had a cervical adenitis four months previous to the beginning of the inquiry. A somewhat similar study was undertaken by the Imperial Health Commission of Germany, which investigated the health of 151 children who drank raw milk coming from cows with tuberculosis of the udder. Two of these children between the ages of one and two years developed cervical gland tuberculosis, from which a bovine type of bacillus was cultivated. Some other children showed signs suggestive of tuberculosis. The two children who acquired the disease drank infected milk for long periods, but, except for the glandular infection, were in good health one and one-half and two years later respectively. The Royal Commission on tuberculosis appointed in Great Britain in 1901—immediately after Koch's declaration that human and bovine tuberculosis are distinct diseases—to investigate the question, issued a final report. The commission was instructed to inquire into three questions: 1. Whether tuberculosis in man and animals is the same disease. 2. Whether man and animals can be reciprocally infected. 3. Under what conditions, if at all, the transmission of the disease from animals to man takes place, and what are the circumstances favorable or unfavorable to such transmission. Several interim reports have been made during the progress of this investigation and have been noted in previous numbers of the *YEAR BOOK*. The final report confirms the work of the previous ones, except that the possibility of modifications of the two types of tubercle bacilli suggested in the second report has not been confirmed. It is now stated that both human and bovine tubercle bacilli may be present at the same time in man, but only the bovine bacillus has been found in cattle. The bovine, human, and avian types of tubercle bacilli have all been found in natural tuberculosis in pigs, either alone or mixed. It has been proved that fatal cases of phthisis in adults may be caused by the bovine bacillus. This is important, since Koch, while three years ago accepting the statement of the commission as to fatal mesenteric tuberculosis being caused in children by the bovine bacillus, still held that all cases in the adult were due to the human bacillus alone. The human and bovine types of bacilli are

found to be morphologically indistinguishable, although showing some differences in their cultural and pathogenic properties. The bovine bacillus produces a fatal tuberculosis in cattle, rabbits, guinea-pigs, chimpanzees, monkeys, goats, and pigs. The human bacillus produces a fatal tuberculosis in guinea-pigs, chimpanzees, and monkeys, but causes only slight and non-greivous lesions in cattle, goats, and pigs, even when administered in large doses. No anatomic or clinical difference was found in the cases of fatal tuberculosis in man, produced by the bovine and the human bacillus. Man must therefore be added to the list of animals notably susceptible to bovine tubercle bacilli.

The second question, whether animals and man can be reciprocally infected with tuberculosis, was difficult to answer, for, though the liability of animals to infection from man could be experimentally tested, man's liability to infection from animals must remain a matter for inference. It was, however, considered proved that mammals and man can be reciprocally infected.

The third question, as to the conditions under which transmission from animals to man takes place, was dealt with extensively. Man has been multiplying the human type of bacillus, to which he is most susceptible, in the bodies of other animals, and thus increasing his chance of infection; but animals capable of suffering from severe generalized human tuberculosis are comparatively few, and none of them are commonly used for foods. Cattle, for instance, are not active multipliers of the human bacillus, being, on the contrary, highly refractory to this infection, and the cow herself, while excreting bovine bacilli in her milk, has never been found under natural conditions to eliminate in this way the human type of bacillus. Experimentally, it is true, the human bacillus has been made to appear in the milk of the cow and goat, but to bring this about immense doses of bacilli have been required. Nevertheless, it cannot be affirmed that man is entirely free from risk of infection through animal food with that type of bacillus to which he is most prone, though the degree of danger is undetermined. In 128 cases of fatal tuberculosis in the human adult, especially in lung cases, the lesions were due, with few exceptions, to human bacilli. In abdominal tuberculosis, it was very different, especially in children. Of young children dying from primary abdominal tuberculosis, nearly one-half of the cases could be referred to the bovine bacillus alone, and there can be no doubt, therefore, that a considerable proportion of the tuberculosis affecting children is of bovine origin, especially that which affects primarily the abdominal organs and cervical glands; nor can there be any doubt that primary abdominal tuberculosis, as well as tuberculosis of the cervical glands, is due to the ingestion of tuberculous infective material. A considerable portion of this material is declared to be infected milk.

TUCKER, W. J. See LITERATURE, ENGLISH AND AMERICAN, Religion.

TUFTS COLLEGE. An institution of higher learning at Tufts College, Mass., founded in 1852. The total number of students enrolled in all departments of the college in 1910-11 was 1107. The faculty numbered 225.

Among the changes in the faculty during the year were the following: George Thompson Knight, Packard professor of Christian theology, died September 10, 1911; Lawrence B. Evans, professor of history, and Thomas Whittemore, professor of English and instructor in the history of art, were given leave of absence; A. L. Andrews, Ph. D., was appointed associate professor of history; and A. A. Berle, D. D., was appointed Woodbridge professor of applied Christianity. The college received during the year from the estate of Mary A. Richardson \$20,000 and from the estate of Caroline M. Barnard \$10,000. The amount of the productive funds of the college is \$1,090,726 and the income is about \$50,000 annually. The library contains about 65,000 volumes. The president is F. W. Hamilton, D. D., LL. D.

TUNGSTEN. See CHEMISTRY, INDUSTRIAL.
TUNGSTEN LAMP. See ELECTRIC LIGHTING.

TUNIS. A north African French protectorate, having an estimated area of 64,600 sq. miles, and a population (1910) of 1,923,217. The capital is Tunis, with 227,519 inhabitants—100,000 Moslems, 50,000 Jews, 18,626 French, 52,076 Italians, and 6174 Maltese.

PRODUCTION AND COMMERCE. The area under principal crops and the total yield for two years (1911 preliminary), with yield per hectare in 1910, are given below:

	Hectares		Quintals		Qs. per ha.
	1910	1911	1910	1911	
Wheat	458,000	505,000	1,100,000	2,350,000	2.4
Barley	505,200	453,000	900,000	2,050,000	1.8
Oats	50,000	50,000	489,000	550,000	9.8
Corn	20,000	20,000	62,000	65,000	3.1
Vines*	14,100	14,095	250,000	454,700	17.7

* Yield in hectoliters.

The mining output has increased during recent years; copper, lead, zinc, phosphates, and iron are raised. The fisheries products are important. The native indoor industries include wool spinning and weaving; carpets, slippers, and saddle making; the manufacture of pottery and matting weaving.

The trade is given below for three years in francs:

	1908	1909	1910
Imports	123,028,000	114,447,000	105,497,000
Exports	94,155,000	109,166,000	120,401,000*

* Phosphates, 32,330,000 francs; olive oil, 17,091,000; cereals, 12,246,000; wine, 7,631,000; zinc ore, 5,454,000; lead, 4,294,000; iron, 4,153,000; fish, 4,092,000; animals, 3,994,000; skins, 3,648,000; esparto, 3,107,000; fruits, 2,624,000; sponges, 2,598,000; woollens, 2,180,000; cork, 1,723,000.

France contributed imports and received exports valued at 59,255,000 and 59,379,000 francs respectively; Algeria, 12,360,000 and 18,690,000; Great Britain, 11,015,000 and 10,779,000; Italy, 5,874,000 and 21,744,000. In 1910 there entered at the ports 12,297 vessels, of 4,151,050 tons. Railways (1910), 1532 kilometers; telegraph lines, 4630 kilometers; wires, 16,004; number of offices, 204; of post offices, 415.

FINANCE AND GOVERNMENT. The budget for 1911 showed revenue amounting to 108,832,148 francs; expenditure, 108,821,131. Revenue derived from direct taxes, 10,964,800 francs; in-

direct taxes, 16,138,400; state monopolies, 18,077,600; domains, 3,041,100; other ordinary, 3,737,040; extraordinary, 15,873,208. Expenditure for public works, 58,748,192; finance, 31,010,957; administration, 6,839,009; instruction, 4,145,399; posts and telegraphs, 3,694,900; etc.

Sidi-Mohammed en Nasser was in 1911 the reigning bey. The government is administered through a French resident-general (1911, G. F. Alapetite), under the direction of the French Foreign Office.

TUNNELS. THE LOETSCHBERG TUNNEL. This great tunnel which had been in process of construction since 1906 was reaching completion in 1911, and the two headings met on March 31, 1911, after 2532.5 working days had been consumed in the work. This tunnel which has been discussed in the 1909 and 1910 issues of the YEAR BOOK is the third longest tunnel in Europe, being over nine miles in length under the Loetschen Pass. It differs from previous tunnel construction in that in portions the track is curved, though this was not contemplated in the original plans but was made necessary by the breaking through of the river Kandar at an early stage of the construction. The Loetschberg tunnel is part of a line from Bern to Brig, on which other engineering features have proved hardly no less serious than the actual tunnel excavation. These include cuts, embankments, and bridges, all of unusually serious character, so that the entire line is one of the most notable in European railway construction. The new tunnel makes possible the quick connection from France with the Italian railway system, which it connects with various French and Swiss lines on the north. The estimated cost of the project has been in the neighborhood of \$17,500,000. At the end of the year almost all of the masonry work of the tunnel had been completed, and active progress was being made with the railway installation itself, special forms of electric locomotives having been designed for this purpose.

SUBWAYS. BOSTON-CAMBRIDGE. During the year there was under active construction a subway extending from Park Street, Boston, to Harvard Square, Cambridge, a distance of 17,000 feet. This subway consisted of a tunnel under Beacon Hill to a point at the corner of Phillips and Grave streets, where it emerged and was carried as an elevated structure on private land to the corner of Charles and Cambridge streets, whence it crossed the Charles River on the Cambridge Bridge, which was built in 1907 with available space for such railway tracks. From the Cambridge end of the bridge a descent is made again into the Cambridge subway proper. The Boston portion of the tunnel was built by the Boston Transit Commission, while the elevated section in the city of Boston, and the entire work in Cambridge, were done by the Boston Elevated Railway Co. In Cambridge much of the work was done in open cut, but considerable tunneling had to be done in which a shield under atmospheric pressure was employed. Where the shield method was used, an arched roof was constructed of concrete.

The Beacon Hill tunnel is about 2500 feet in length, with about 300 feet in open cut at or near the surface of the ground. It was constructed through a very hard mixture of sandy clay containing numerous small stones, and occasionally boulders, by using a hydraulic shield,

and following up the work rapidly with the concrete. The system also involves the construction of a number of stations, including terminals at Park Street and at Harvard Square. This subway is a portion of the comprehensive plan for the development of rapid transit facilities between the central part of the city of Boston and its outer portions and suburbs. Subways previously had been constructed under Washington and Tremont streets, the latter for the use of the surface cars, and to distribute the traffic to the different outlying sections of the city.

NEW YORK SUBWAY. Work on the New York subway system progressed slowly during 1911, the questions relating to the granting of the franchises for new lines and extensions being argued almost endlessly by the various interests concerned. While the Brooklyn Fourth Avenue subway was well advanced at the end of the year, in fact was near completion, very little work has been done on the new Lexington Avenue subway. Six contracts, aggregating about four miles long, were reported as being under way January 1, 1912, five of these being under one contractor, and a seventh section was soon to be started. With the inconveniences of previous subway construction in mind it was provided that all the construction work be done without active interference with street traffic, a plank roadway surface being laid and excavation carried on beneath. At the end of December, about half a mile of such temporary roadway had been laid; earth and rock excavation was being carried on over a somewhat greater length of line, and shafts were being sunk for tunneling.

The Brooklyn Fourth Avenue subway was about 80 per cent. completed. It was divided into six contract sections, at an aggregate of contract prices of \$14,807,000. Over 2500 men were employed on this work at the end of the year. The most advanced section was 95 per cent. completed, while the most backward was 67 per cent. completed.

Late in the year work was resumed on the southern terminal part of the Centre Street loop subway, including the terminal station under the new Municipal Building and the approach thereto. This project had been retarded for a long time on account of the construction of the Municipal Building, although the rest of the loop costing some \$10,000,000 had been completed for over two years and was lying idle.

THE NEW KINGSWOOD TUNNEL. A new tunnel piercing one of the lesser ridges of the Allegheny Mountains west of Tunnelton in Preston county, W. Va., was one of the interesting engineering features of the double tracking of the Cumberland Division of the Baltimore & Ohio Railroad between Blaser and West End, W. Va. Previously the traffic had been handled through an old single track tunnel at Kingswood, but it was determined that a new tunnel should be built with a reduction of grade and curvature which would take care of the heavier or east-bound traffic, leaving the west-bound traffic to the old tunnel. The new tunnel is 31 feet in clear width, and 24 feet 6 inches in clear height, being of adequate size for two railway tracks. The roof is a semi-circular, 5-ring, brick arch, 15 feet, 6 inches radius, and the sidewalls are of concrete, with a minimum

thickness of not less than 24 inches. Space is provided for wire and cable conduits, if necessary for electric working in the near future. The new tunnel is 4211 feet in length, as compared with 4149 feet for the old tunnel, and it has been cut through a dense gray shale which disintegrated rapidly on exposure to the air. The work was begun on September 26, 1910, and at the end of December, 1911, was about 90 per cent. completed.

CHICAGO RIVER TUNNEL. The success attending the Detroit River tunnel which consisted of steel tubes sunk in a trench excavated in the river bottom and then covered with concrete led to a somewhat similar form of construction for a tunnel under the Chicago River at LaSalle Street. Here also a deep trench was dredged in the river bed and in this was sunk a twin tube steel shell whose ends were closed with wooden bulkheads. This shell was nearly 300 feet in length and its ends were supported on bearings. By pumping sand under and around the tubes the shell was covered and then the tubes which had been partly lined with concrete were completely coated within with concrete which was pumped under pressure of from 35 to 45 pounds through pipes from a hopper on the shore.

CLEVELAND SHORT LINE TUNNEL. A tunnel of concrete with its arch and side walls heavily armored was built on the Cleveland Short Line in water-bearing gravel and fine sand. It is of horseshoe section 25 feet wide at the floor, 25 feet 9 inches high, and 30 feet 6 inches wide at the springing line. The lining of the tunnel is 57 inches in thickness and the base which is reinforced with both vertical and horizontal transverse bars is 6 feet 6 inches.

SAVAGE TUNNEL. In building the Savage tunnel for the Western Maryland Railway soft wet material was encountered and the pneumatic system was used in the excavation. The method employed was first to excavate the upper part or a top heading in which a lock was placed, following this by digging out the sides leaving a central portion to support the roof timbering and the braces of the side trenches. The walls and roofs of concrete were then built.

During 1911 the consideration of a subway scheme for the city of Toronto was before the municipal government. It was proposed to build a three-mile double-track subway from the water front north to the city limits. Underground construction was being carried on in Buenos Ayres. TURCO-ITALIAN WAR. ITALY'S ULTIMATUM. The civilized world was startled by the announcement on September 28 that on the night of Tuesday September 26 Italy had sent an ultimatum to the Turkish government concerning her rights in Tripoli, stating the grievances of Italy against Turkish misgovernment in that province, requesting the Porte to give orders permitting the occupation of Tripoli by Italy, and declaring that if a reply were not received within twenty-four hours Italy would at once take measures to insure the occupation. The news was wholly unexpected, for although there

had been reports of Italian complaints from time to time, they were not believed to be of a serious nature. The purport of Italy's ultimatum was as follows: After reciting the grievances of the Italian government owing to the disorder and neglect in which the Turkish government left Tripoli and Cyrenaica and characterizing the course of the Porte as hostile to legitimate Italian activity in these regions, it declared that the economic concessions now proposed by the Porte came too late and that the Italian government believed from the result of past experiences that further negotiations were useless. It further declared that the situation in Tripoli and Cyrenaica was extremely dangerous and that Italian subjects were leaving Tripoli. The sending of military transports from Turkey aggravated the situation. Therefore the Italian government declared its intention to proceed to the military occupation of Tripoli and Cyrenaica, and required the Porte to give orders that would prevent any opposition to such occupation. It demanded a reply within twenty-four hours. The Porte's reply was regarded by the Italian government as unsatisfactory and a state of war between the two countries existed after half-past two on Friday afternoon, September 29.

NAVAL OPERATIONS. Later on the same afternoon occurred the first act of war, namely, the sinking of three torpedo boats off Prevesa on the coast of Epirus by the squadron commanded by the Duke of the Abruzzi. The government declared that this was necessary to prevent a sudden attack by the Turks on the Italian fleet, but it assured the powers of Italy's intention to confine the war strictly to Tripoli and Cyrenaica. A second squadron was dispatched under Vice-Admiral Aubry to blockade Tripoli and demand its surrender. This being refused a bombardment was begun on October 3. The Turkish cabinet resigned and Said Pasha, president of the Senate, was appointed grand vizier. After some difficulties he formed a new cabinet of the same political tendencies as its predecessor. Great indignation was felt in Turkey at the high-handed course of Italy and notes of protest against the Italian ultimatum were addressed by the Porte to the powers. These notes declared that although the Ottoman government was free to proceed as in a state of war, it believed that the war could still be brought to an end and urged the powers to take steps for that purpose. The Italian plan of campaign was reported to be as follows: The fleet was to blockade the Tripolitan coast and prevent the landing of Turkish reinforcements; and war vessels were to be distributed along the Albanian and Macedonian coasts to prevent naval attacks or privateering, and to protect Italians and foreigners on Ottoman territory. To allay the fears of the powers, especially of Austria-Hungary, the Italian government declared it had no intention of landing in any part of the Ottoman empire except Tripoli and Cyrenaica. The cruisers in Tripolitan waters were to begin the occupation as soon as they received orders. The bombardment of Tripoli was begun at 3:30 on October 3 by a division of war vessels under Vice-Admiral Faravelli. The forts were soon demolished and fire broke out in several of the military buildings. White flags were seen, and the fleet began to send out landing parties. On October 5 two battalions of seamen and marines took possession of the city.

THE LAND FORCES. The expeditionary force, whose number could not be exactly ascertained, was estimated at 25,000 infantry and 1000 cavalry and artillery, which, with the engineers and auxiliary bodies, including the Red Cross detachment, came to about 35,000. No resistance was offered by the Turkish force, which had withdrawn into the interior. Concerning its number there was much doubt, estimates varying from 5000 to 10,000. On October 13 General Caneva, with an expeditionary force, landed at Tripoli. The plans of the Turkish forces in the interior were still unknown. There were occasional engagements, but they were affairs of outposts and of no especial importance. A force of Turkish cavalry was reported to be at an oasis a short distance from Tripoli. The situation seemed hopeless at first for Turkey because, Italy controlling the sea, it was impossible to send reinforcements. General Caneva upon his arrival addressed a proclamation to the natives saying that Italy had not come to enslave the population, but to restore to them their rights and to punish the usurpers, and that the inhabitants would be governed by the chiefs under the patronage of the king of Italy and would be treated with justice, clemency, and gentleness. The engagements in Tripoli were of little military importance. On October 18 a convoy of troops, escorted by eleven warships, arrived in Benghazi and demanded its surrender. This being refused, bombardment was begun on October 19, and the marines and troops immediately landed. They encountered determined resistance at first, but they succeeded in occupying the city. The casualties were slight. In Tripoli the Italians were menaced by the fanatical spirit of the Arabs.

REPORTED MASSACRE. A fanatical rising of the Arabs occurred on October 23 in Tripoli and in the oasis outside the city. According to reports, which came largely through British sources, the Italians avenged themselves by a wholesale massacre of the Arabs. According to one account the Turks were known to have distributed 10,000 stand of magazine rifles and ammunition to the Arabs. The Italians had succeeded in collecting only 3000 of these. Thus when the Arabs arose, the Italians thought they might have to deal with several thousands of armed men and that they must therefore strike a blow which would crush them completely on the start. According to the *London Times* correspondent, the retribution inflicted upon them was terrible, but far less so than the indiscriminate bloodshed that would have followed had the rising not been premature. According to some reports the troops had orders to kill all Arabs found in the oasis and to search from house to house for arms and ammunition. It was said that the troops went throughout the oasis, shooting indiscriminately all whom they met, the innocent and guilty alike and even young persons and women. The Italian government promptly denied the reports of cruelty, and the premier declared that the facts were as follows: There was a sudden rising of the Arabs in Tripoli in an oasis on October 23. They concealed their rifles in their houses and attacked the Italians in the rear, while other Arabs joined the Turks in attacking them in front, thus indicating a preconcerted plan of treachery. The Italian troops, after sustaining some severe losses, repulsed the attacks both in front and in rear. It became necessary then to

punish those Arabs who had committed special criminal acts and to clear the oasis of the traitors. All who were found with arms in hand during the fight or immediately after were shot, and those who were found guilty of murder after regular trial were also shot. About 2200 other Arabs were arrested for conniving at treachery or disobeying the orders of the government for the surrender of all arms. These were transported to the Italian islands. In the days following October 23 similar outbreaks occurred and were repressed in the same way. The premier went on to say that there was no systematic slaughter of unarmed people or of women and children and no indiscriminate repression. Although it was necessary to destroy the walls in the oasis and everything that could shelter the rebels, this was not done until the non-combatants had been removed. He says that the Arabs, on the other hand, were guilty of shocking atrocities, citing the case of the two companies of Bersaglieri, who lost 300 men and had only 14 wounded, as indicating that the wounded must have been massacred. The reports on the subject were very conflicting. Eye witnesses testified to the butchery of unarmed Arab men and boys in circumstances of shocking inhumanity. Others published communications completely exonerating the Italian troops.

PROGRESS OF THE CAMPAIGN. During the engagements of October 23-25, the Italians were reported to have lost 374 killed and 158 wounded. Conflicting reports were published in the last week of October concerning an attack in force by the Turks on October 26, each country claiming the victory. According to the Turkish account the Italians had been completely routed. From Italian sources, on the other hand, it appeared that the conjoint attack of the Turks and Arabs on October 26 had failed and that the Italians had made a successful counter attack. The Turks made another attack on October 28, and, according to the Italians, were again repulsed. The Italians were compelled to draw in their lines of defense, abandoning the forts to the east of the town, but on November 7 they recovered them from the Turks. On December 5 an Italian success was reported, by which they gained possession of the oasis. Meanwhile, during November, they had established their control over the towns on the coast. At the close of the year the situation seemed favorable to the Italians, who were apparently in a fair way to hold the country against the Turks, though its subjugation promised to be a long and tedious task.

INTERNATIONAL ASPECTS. There were many vigorous protests in the European press against Italy's course. As the war began both Germany and Austria-Hungary had appealed to Italy, their ally, and to Turkey, but in vain. In Italy itself a number of the Socialists condemned the action of their government, but the party was divided on the subject (see **SOCIALISM**) and public opinion generally favored the war. In Turkey the situation of the government was embarrassing. On the one hand its foreign advisers urged it not to make reprisals, but to accept the situation. On the other, a strong patriotic element opposed surrender and demanded a policy of guerilla warfare in Tripoli (see **TURKEY, History**). During the first two weeks of October there was still hope in the foreign cabinets that mediation might restore peace. In Germany especially there was much

talk of a settlement of the dispute. Overtures to that end were made by Germany, and apparently by the other powers, but it seemed that secret understandings between certain of the powers added to the difficulty of such an adjustment. On November 5 the Italian government formally proclaimed the annexation of Tripoli and Cyrenaica. From the first Turkey had appealed to the other powers against the conduct of Italy, but at the close of the year there seemed no other solution than acquiescence in the Italian conquest and acceptance of the indemnity which Italy offered. The other powers were seeking to induce the Ottoman government to yield on these terms.

TURKESTAN. See EARTHQUAKES; IRRIGATION.

TURKEY, or the OTTOMAN EMPIRE. An empire possessing extensive territories in southwestern Europe, western Asia, and northern Africa. Nominally subject to Turkey are Samos, Crete, and Egypt (qq. v.). Capital of the empire, Constantinople.

AREA, POPULATION, ETC. Exclusive of the nominal dependencies, the area and population of Turkish possessions appear in the following table:

	Sq. miles	Population
Total Turkey in Europe	65,367	6,130,000
Asia Minor	193,600	9,089,000
Armenia and Khurdistan	72,000	2,471,000
Syria	114,600	2,890,000
Mesopotamia	131,700	1,398,000
Arabia	170,300	1,050,000
Total Turkey in Asia	682,200	16,898,000
Tripoli and Bengazi	405,800	1,000,000
Total empire	1,153,300	24,028,000

Turks, Greeks, and Albanians compose about 70 per cent. of the population in European Turkey; in Asiatic Turkey there are Turks, Arabs, Greeks, Kurds, Circassians, Armenians, etc. Of the total population some 16,000,000 are Mohammedans and about 5,000,000 are Christians of the Roman, Greek, and other churches. Important cities of European Turkey are Constantinople (942,900 inhabitants without and 1,106,000 with suburbs); Saloniki (144,200); Adrianople (125,000); Monastir (50,000); of Turkey in Asia—Smyrna (285,000); Damascus (200,000); Beirut (185,000); Aleppo (135,000); Bagdad (125,000); Trebizond (100,000).

Education, in the hands of the Mohammedan priesthood, is totally inadequate.

PRODUCTION. Agriculture is carried on by primitive methods. The wheat produced in 1910 (in 20 provinces and sub-provinces) was 44,845,254 quintals; rye, 4,772,825; barley, 29,004,763; oats, 4,477,779; corn, 11,245,921. The annual output of olive oil has been estimated at about 750,000 quintals; about 150,000 quintals are exported, 150,000 are consumed by the soap factories, and the remainder by the home market. The increased cost, however, has led to the substitution of large imports of animal fats and other oils. Figures for 1909-10 tobacco crop are lacking; but exports to Egypt amounted to 8,000,000 pounds and to other countries to 69,822,834 pounds. The opium yield was about 10,000 cases, of extra quality. Other products are figs (from Smyrna), raisins, wine, nuts, canary seed, and linseed. Cotton is raised in increasing quantities. Oriental rug

factories are being established to supply the world demand; Constantinople continues to be the main centre of distribution. Wool and mohair are exported.

The abundant mineral wealth of the country is undeveloped. Transportation is inadequate, and labor is not plentiful. Coal is mined (654,118 tons in 1909), as well as phosphate of lime, copper, zinc, iron, silver, gold, antimony, etc. Salt is a government monopoly.

COMMERCE. Figures for the trade of the Ottoman Empire are far from reliable. The returns from countries of origin and destination all show wide differences when compared with Turkish returns, the Turkish export statistics being much too low. Later figures than for the year ended February 28, 1909, are unavailable, the imports for that year being reported at £T31,432,230 and the exports at £T18,439,070 (1905-6, £T31,366,020 and £T19,672,360). The main articles of import are cottons (£T4,090,000 in 1905-6), sugar (£T2,640,000), cereals, etc. (£T1,560,000), linen (£T1,045,055), yarn (£T1,470,000), woollens (£T1,300,000), rice (£T1,077,243), petroleum (£T1,037,198), coffee (£T946,570). Exports are raw silk and cocoons (£T2,930,000), raisins (£T2,350,000), cereals, etc. (£T1,880,000), mohair (£T914,000), figs (£T902,279), coffee (£T889,004), opium (£T729,127), skins (£T730,000), valonia (£T625,224), vegetables (£T580,000), minerals (£T554,082), fruits (£T550,000), carpets (£T546,060).

The countries of origin and destination are as follows, with the value of their trade in 1908-9 in thousands of pounds Turkish (£T1= \$4.40):

	Imps.	Exps.		Imps.	Exps.
Great Brit.	9,413	5,187	Bulgaria	1,356	568
Aus.-Hun.	4,075	2,478	Rumania	1,262	384
France	3,371	3,684	Egypt	1,163	1,657
Russia	2,494	5,749	Netherlands	634	251
Germany	1,938	1,150	Servia	603	99
Belgium	870	174	Persia	554	94
Greece	896	436	U. S.	411	703

There entered at the ports of the empire, in 1905-6, 47,265 steamers (44,257,892 tons) and 129,796 sailing vessels (2,293,977); at Constantinople, in 1908, 14,709, of 13,261,446. Merchant marine (1911), 120 steamers, of 66,878 tons, and 963 sailing vessels, of 205,641.

COMMUNICATIONS. Of the railway lines (6558 kilometers) open in 1909, 1994 kilometers were in European Turkey, 2372 in Asia Minor, and 2192 in Syria. The foreign roads, with the exception of the Aidin line (English), have a kilometeric guarantee from the government.

Railway lines under construction are the Bagdad line, 1820 kilometers long, beginning at Eregli, passing through Aleppo, and ending at El Khalif (German). Aidin line (British). Smyrna-Kosbat line, 200 kilometers long, running as far as Panderma (French). Tripoli-Homs line, 102 kilometers long (French). The Hodeida-Sanaa line was begun March 2, 1911, when Gen. Izzet Pasha cut the first sod. Other lines were projected, but the war will probably interfere with plans for such work in the near future. A French company has been awarded a contract to build and repair about 9000 kilometers of public roads in the various vilayets of the empire, the work to be completed at end of 1913; cost of construction, about 70,000,000

COPYRIGHT, 1907, BY DODD, NEAD & CO.

REVISED 1911

francs. Telegraph lines (1909), 45,466 kilometers; wires, 76,738; number of offices, 1095.

FINANCE. The piastre (worth about 4.4 cents) is the monetary unit; there are in one pound Turkish 100 piastres. Estimated revenue 1910-11, £T25,848,332; 1911-12, £T26,819,101. Estimated expenditure 1910-11, £30,270,246; 1911-12, £T36,233,184. The receipts as estimated in 1911-12 were £T13,552.11 from direct taxes, £T5,359,973 from indirect taxes, £T3,438,080 from monopolies (salt, tobacco, and gunpowder), £T1,277,355 from stamps, etc., £T893,871 from tribute (Egypt, Cyprus, Mount Athos, and Samos), £T793,636 from domains, £T239,587 from revenue-earning administrations, £T1,264,488 various. Expenditure: £T14,687,625 for finance and public debt charges; £T1,961,933 for public safety and gendarmerie; navy, £T1,682,716; public works, £T1,553,866; grand-vizierate, council of state, and interior, £T1,415,299; war, £T9,491,574; public instruction, £T994,481; etc.

The public debt stood March 14, 1911, at £T119,742,859. A loan of £T11,000,000 was raised in 1910.

ARMY. Military service in Turkey is compulsory for all Mussulmans, who are liable to serve in the Nizam, or regular army, the Redif, or Landwehr, and the Mustafiz, or Landaturm. Christians, and certain other sects, may pay an exemption tax, while from various parts of the empire such nomadic troops as the Arabs fail to furnish recruits, and the Kurds are apt to avoid military service, which consequently falls heavy and mainly upon the Osmanlis or Turks proper. The new organization adopted in 1910 was being carried out in 1911. This provided for a regular army consisting of 14 army corps grouped in 4 army inspection commands, and of 6 independent divisions, of which 3 are under the second army command though not included in any army corps, while 3, Tripoli, Assyr, and Hedjaz, are entirely independent. In all, there are 43 regular divisions, varying in composition, but in time of peace those of the first class consist of 3 infantry regiments of 3 battalions each, 1 rifle battalion, 1 company of mounted infantry, 1 regiment of field artillery, with 619 batteries. One of the 3 battalions of 1 regiment is only a "cadre" unit, so that on the peace basis there are 17 active battalions in a division, and on a war footing there are 10. It will be apparent that the principle underlying the organization of the Turkish army is of groups of three, 3 battalions making a regiment, 3 regiments a division, and 3 divisions making a corps. In fact, the normal organization of an army corps consists of 3 divisions of infantry, 1 regiment of rifles, 1 brigade of cavalry, 1 battalion of heavy howitzers, with 4 companies, each of 2 battalions of mountain artillery, 1 battalion of engineers, 1 telegraph company, and 1 train battalion. In the 10th, 11th, 12th, and 13th army corps there are but two divisions of infantry. The cavalry is organized in brigades, one of which is essential to each army corps, while the field artillery is organized in brigades, which consist of 2 regiments of three 4-gun batteries each. The organization of the Turkish army, which is the work of Field Marshal von der Goltz, is unique in that the infantry brigade formation was abolished, and there is no unit in the command between the division and the regiment, leading perhaps to difficulty of control for the

commander of a division in active operations. On the other hand, for limited operations the new plan was thought well suited to the Turkish troops. The total strength of the army was estimated in 1910 as follows:

	Peace	War
Infantry	150,000	975,000
Cavalry	21,000	25,000
Artillery:		
Men	35,000	45,000
Field guns	1,320	1,600
Machine guns	110	572
Other arms	25,000	30,000
Other trained men available for war		100,000
Total personnel available	231,000	1,175,000

These figures probably held good in 1911, but it must be borne in mind that this large force is very widely distributed throughout the Turkish empire, and many of the troops were in Asia Minor.

The Hamidieh, or native cavalry, was reorganized, the resources of the country not having permitted the formation of the 65 regiments as had been decided. The new organization was to comprise 24 regiments of 4 or 5 squadrons, and 1 independent squadron. These 24 regiments were separated unequally in 4 divisions as follows: Erzerum, First Division, of 6 regiments and 1 squadron, Kara-Kilissé, Second Division, of 8 regiments; Ardjisch, Third Division, of 5 regiments; Mardin, Fourth Division, of 5 regiments.

NAVY. At the outbreak of hostilities with Italy, the navy included 4 battleships of 35,000 aggregate tons; 3 armored corvettes, of 7600; 2 protected cruisers, of 7000; 2 torpedo cruisers, of 1550; 1 torpedo cruiser, of 900; 2 torpedo dispatch boats, of 1300; 9 torpedo-boat destroyers, of 3970; 15 first-class torpedo boats, of 2000. In course of construction, 1 protected cruiser. Reported ordered were 2 battleships, of 23,000 tons each, to have a speed of 21 knots, and 10 13½-inch guns. Early in 1911 3 merchant steamers purchased from the North German Lloyd Company were delivered—the *Oldenburg*, the *Darmstadt*, and the *Roland*. They will be used as armed transports.

The British officers whose activity as instructors in the admiralty ceased at the beginning of the war were reported to have resumed their duties, but on a basis which relieves them of any implication of being concerned in the hostilities. The personnel includes 30,000 officers and men.

GOVERNMENT. Turkey is a constitutional hereditary monarchy. The sovereign (in 1911, Mohammed V.) is both temporal and spiritual head. The fundamental laws are based on the precepts of the Koran. The succession to the throne rests in the senior male descendant of the house of Osman, sprung from the imperial harem. The sultan does not marry; but all children born in the harem, whether of free or slave women, are counted legitimate and of equal lineage. A grand vizier, assisted by a cabinet of ministers, is appointed by the sultan. The legislative body consists of a senate and a chamber of deputies. The empire is divided administratively into vilayets, sanjaks, kazas, nahies, and karies. The sheikh-ul-Islam is the head of ecclesiastical affairs under the sultan.

Ministerial changes occurred frequently in 1911. The grand vizier, Hakki Pasha, resigned

at the beginning of the Turco-Italian War, to be succeeded by Said Pasha, the then president of the Senate, a man over ninety years old. He had been, during the reign of Abdul Hamid, seven times grand vizier. Upon the defeat in December of his amendment to the constitution, he with his entire cabinet resigned; but he was summoned almost immediately to form a new cabinet—his ninth. The cabinet which was constituted October 4 and which resigned December 30, 1911, was composed as follows: Grand Vizier (premier), Said Pasha; Sheikh-ul-Islam, Kiasim Effendi; Foreign Affairs, Assim Bey; Interior, Djelal Bey; Justice, Memdough Bey; War, Mohammed Shevket Pasha; Marine, Khurshid Pasha; Finance, Nail Bey; Pious Foundations, Adurrahman Bey; Commerce and Public Works, Khulussi Bey; Instruction, Khaïri Bey; Agriculture, Mines, and Forests, Kirkor Sinapian Effendi; Posts, Telegraphs, etc., Ibrahim Soussa Effendi.

HISTORY

The year 1911 was marked by a foreign war and by serious internal disturbances. The outstanding event was the TURCO-ITALIAN WAR, an account of which will be found under that title. Other aspects of Turkish foreign affairs are treated under the titles of the countries to which they relate. For Turkey's part in the railway projects of the Near East, see GERMANY, *History*, paragraph on *Bagdad Railway*. For the relations with Greece, see CRETE, *History*; see also concluding paragraph below on *Other Events*. The present article is confined chiefly to internal affairs, including the two threatening revolts at opposite ends of the empire, that in Yemen and that in northern Albania, and the dissensions in the Young Turk party.

THE YEMEN REVOLT. At the beginning of the year a revolt broke out in Yemen under a fanatical chief named Said Idris and the Imam of Sanaa. During January it assumed formidable proportions and the Turkish troops in the region were thoroughly reinforced. Fighting occurred in January on the Hedjaz Railway and a defeat of the Bedouin was reported, but in the following month an Arab force, 15,000 strong, was reported to be advancing. At the end of February a repulse at Menakha of 2000 men under the imam by Turks and friendly Arabs was reported. The loss of the rebels was placed at 130, and of the government troops at 161. The retreat of the imam was reported in March, and by April 15 the Turks were thought to have the situation well in hand. At that time the imam was reported to have lost very heavily. But in June news came of a serious reverse to the Turks near Gezam, where the rebel Arabs surprised four battalions, inflicting a loss estimated at 1600, including 1100 killed, and driving the remainder in disorder. Upon receiving the news the government decided to send eight more battalions of the Redif and four of regulars from Adana. The town of Ibha was besieged by Said Idris and the important city of Sanaa by the imam, and the prestige of the Ottoman government was seriously threatened, but with the arrival of the reinforcements, conditions improved. On July 1 Ibha was relieved and by September 1 it was reported that all the sheikhs had submitted. The campaign was conducted by Izzet Pasha.

THE ALBANIAN REVOLT. A still more threatening revolt broke out among the tribesmen of

northern Albania, who in December, 1910, had been reported pacified. At that time the grand vizier announced that the measures for disarmament which followed the revolt of 1910 were completed and that the troops were being recalled. Soon afterwards, however, a number of the Catholic Malissori demanded the reopening of the native schools and the use in them of the native language, and refused to lay down their arms until these terms were granted. They took the offensive at the end of January and fighting of a serious nature was reported in March on the Montenegrin frontier, where they were said to number about 3000 and to have captured several blockhouses. It was soon afterwards learned that they had seized Tuzi and were threatening Skutari and that the regular troops in the region were hard pressed. Torgut Shevket Pasha assumed command of a large relieving force in March and planned an advance in two columns which should ultimately hem the rebels on all sides in an "iron circle." The news came from official sources and the exact nature of the operations could not be ascertained, but the objects of the campaign were not gained till after four months, during which the Turks were reported to have met with several serious reverses. In the middle of April the Turks were reported to have occupied the chief strategic points in the disturbed region, but at the end of April it was announced that the Turks had met with a serious repulse at the hands of the Malissori, and that their attack on the insurgent position at Dechitch had been repulsed with heavy losses. Another Turkish reverse was reported at the beginning of May.

Reinforcements were rapidly poured into Saloniki in May, and it was reported that the fighting in the west was continuing with doubtful results. The Albanian clergy refused the request of the Turkish authorities to try and induce the natives to submit. By that time it was estimated that the fighting force of the revolutionaries was 20,000. In May there were further reports of fighting in Albania, but the news was indefinite. The Turkish troops were at that time on the Montenegrin frontier and the Montenegrin government was led by the threats in the Turkish papers to appeal to the powers for a guarantee of its territory against Turkish attacks. Torgut Shevket Pasha issued a proclamation in the middle of May warning the people that extreme measures would be taken against all those who had not returned to their villages and surrendered their arms within five days. On June 4 the Mirdite tribe, one of the most powerful in the disturbed district, was said to be in revolt. It occupied inaccessible mountain regions, and had been independent for centuries, but later it was reported that the Mirdites had been driven out of the Alessio fortress. Progress in the Turkish campaign was reported early in June when the Turks were proceeding against the Malissori tribe. Their plan of campaign was to divide the insurgent force and cut off communications with Montenegro. On June 12 it was announced that the revolt was near its end, Torgut Shevket Pasha having reached the Shem River in his campaign against the Malissori. The two invading Turkish columns met, thus gaining the object of their campaign. The official statement of the terms offered to the rebels was as follows: Ten days for the Malissori rebels to surrender, in which case no

judicial proceedings would be taken against them. The government gave assurances that it would guard the welfare and prosperity of the region and the sultan was to give a sum of money to repair the damage done by the troops.

Despite the proclamation of an armistice, fighting was reported in the disturbed district in June, and it was said that the Malissori tribe was in a position by no means untenable. Nor had the Mirdite tribe submitted. And though an official statement declared the campaign against the Albanian tribes over on June 29, hostilities continued and in the middle of the following month a Turkish force under Adhem Pasha suffered a severe reverse, falling into an ambush and losing about 200 killed and wounded. Peace finally came about largely through the efforts of King Nicholas of Montenegro.

MONTENEGRO AND THE ALBANIAN REVOLT. The Montenegrins sympathized strongly with the Malissori, many of whom took refuge on Montenegrin soil. Much of the fighting occurred on the border and the Turks complained that the Montenegrins joined the Malissori in their attacks. Early in the revolt the Turkish foreign minister threatened to take action against Montenegro if it continued to aid the insurgents. In May the Turks reported that Montenegrins were fighting in the ranks of the Malissori on several occasions. Turkish threats of reprisal became so vigorous that King Nicholas appealed to the powers for protection, as noted above. Meanwhile reports of the sufferings inflicted on non-combatant Malissori had aroused the sympathy of foreign nations and King Nicholas bestirred himself on their behalf. The insurgents who had taken refuge in his territory demanded certain concessions, including the right to retain their arms and compensation for the damage done to their property. King Nicholas sought to bring all possible influence to bear to induce the Turks to grant these demands. At length the Turks showed themselves inclined to conciliation. In the middle of July Torgut Shevket Pasha was superseded on the ground of illness, by Abdullah Pasha, who offered the insurgents the guarantee of all their local rights and promised them a good government, a general amnesty, and the expenditure of £50,000 by the government in the repair of damages.

On July 20 King Nicholas of Montenegro summoned the representatives of the great powers to a conference at the palace at which he made certain proposals for the arrangement of peace between the Turks and the Albanians. An armistice was declared and the Turkish government agreed to terms of peace, which conceded the demands of the rebels, including the right to retain their weapons and compensation for the destruction of their dwellings.

By August 12 it was announced that the Malissori had all returned to their homes, with the exception of one section of the tribe, but there were reports soon afterwards of fighting in southern Albania.

POLITICAL CONDITIONS. Early in the year there were rumors of dissensions in the Young Turk party, which through its Committee of Union and Progress, had carried through the revolution of 1908 and defeated the counter-revolution of the following year. There were bitter complaints of the secret and tyrannical powers wielded by the Young Turk committee

at Saloniki, which was said to be the real, though unauthorized head of the government. The Saloniki committee was represented in Constantinople by a parliamentary committee of 160 members, which controlled the majority in the lower house. Many ministerial changes took place during the year and a large proportion of these were attributed to the so-called Conservative Young Turk element of the parliamentary committee at the capital, who had turned against the Radical Young Turks of the Saloniki committee. Jalaat Bey, minister of the interior, and Emrullah Effendi, minister of education, resigned in February, and the latter's successor, Ismail Hakki Bey, and Djavid Bey, minister of finance, retired in May. This was regarded as a triumph for the committee insurgents within the cabinet who were supported by active public sentiment outside Parliament. The fall of Djavid Bey and the split in the committee party greatly agitated the people of Macedonia. The Parliamentary party in the chamber drew up a new programme, comprising ten articles, on April 22. Among its features were the following: Deputies shall not engage in concession business or similar affairs in private interest, or accept any official or cabinet post unless as a result of a party vote comprising a two-thirds majority of the members in Parliament; respect for the laws on the part of the ministry; coöperation on the part of the party for union of races of the empire; the development of Occidental civilization and progress, with due regard to religious and national usages and public morals; respect for the historical traditions of the empire; legislation for the appointment and dismissal of functionaries; modification of certain articles of the constitution dealing with certain rights of the throne and Khalfate; and opposition of the party to societies organized with secret objects.

On July 10, Zeki Bey, an official of the public debt administration, was shot and killed. This was regarded as a political murder, prompted by the Saloniki party, and caused considerable excitement. He had been arrested during the disturbances of July, 1909, but was acquitted by a court martial. At the time of the split in the committee party he had founded a journal, which attacked the Saloniki committee vigorously. Several prominent men were arrested on suspicion of complicity in the murder, which was held to be the work of extremists who resented his political activities, and the trial which was going on in the latter part of the year brought to light some discreditable political intrigues.

In the closing months of the year political conditions were complicated and obscure, but it appeared that at a meeting of the committee in the autumn the Moderate or Conservative element were unsuccessful in carrying their measures, and that the Radical policy of assimilating the subject races would continue. Rumors of the weakness of the Saloniki committee persisted and there were signs of its growing unpopularity, but there was no definite evidence of change.

THE SAID GOVERNMENT. On the outbreak of war with Italy, the Hakki ministry, which was sharply criticised for lack of foresight and ineffective preparations, resigned, and Said Pasha, president of the senate, became grand vizier (October 4). Parliament was opened on October 14. The speech from the throne set forth the causes of the war and the steps taken by the government to secure the mediation of the

powers. A memorial was presented to the speaker by the deputies of Tripoli and Cyrenaica, demanding the impeachment of Hakki Pasha and his colleagues for inefficiency in safeguarding Tripoli. Some of the specific charges were: Diminution of the Tripoli garrison; delay in recruiting local militia; failure in sending rifles for the use of the militia; appointment of officials ignorant of Arabic; failure to anticipate the Italian preparations for war, or to give orders for local defense, etc. The grand vizier outlined the government policy on October 18. It aimed, he said, to improve the relations of Turkey with all foreign countries, especially the Balkan states. A committee was appointed to investigate the question of the previous government's alleged neglect of the defenses of Tripoli. A law was passed taxing Italian imports since the declaration of war at 100 per cent. ad valorem. The Said government seemed at first insecure, but it soon secured a vote of confidence on the understanding that it would maintain Turkish sovereignty in Tripoli. Public opinion was strongly in favor of the expulsion of Italian residents, but the government refused to take this measure.

OTHER EVENTS. Reports that torture had been used to extort a confession from Dr. Riza Nur, who had been arrested in the latter part of 1910, led subsequently to a debate in the chamber which also turned on the treatment of political prisoners generally, but by a vote of 96 to 73 the demand for a commission to inquire into the matter was negatived. At the end of February fighting was reported on the frontier between the Turks and Greeks, and also between Turks and Bulgarians in Macedonia. The trouble on the Turco-Greek frontier led to an agreement between Turkey and Greece for the appointment of a commission of inquiry. Questions relating to the Black Sea frontier were referred to a mixed commission appointed by the Turkish and Bulgarian governments. In a convention signed about March 15, the disputed points concerning a large part of the frontier were regulated. In July the Ottoman Bank negotiated through French capitalists a loan of about \$175,000,000 of whose proceeds more than half were to be applied to the building of the Danube-Adriatic and South Albanian railways. British capitalists secured a concession in August for the building of ports at Trebizond and Samsun. Two serious disasters of the year were the Stamboul fire, which destroyed about 3000 houses, leaving nearly 50,000 people homeless, and the outbreak of the cholera in the summer months, causing over a thousand deaths in Constantinople and showing an even greater mortality in the interior. Attention was drawn to the outrages in the Monastir district by the murder of a Frenchman who was mistaken for a Bulgarian voyvoda. The trouble was said to be due, on the one hand, to Turkish insults, and on the other, to Bulgarian and Greek reprisals. The Turks were accused of murdering Greeks and Bulgarians, and the latter replied by similar acts. The procurer-general at Monastir had been murdered, and terrorists were said to be active. Toward the close of the year there were many signs of unrest in Macedonia and early in December a number of outrages took place which indicated the work of terrorists. A part of a train was destroyed on the line between Saloniki and Seres, and three railway employees were killed. On the same day another

explosion took place between Saloniki and Uskub, and a more serious one in a mosque at Ishtib, the latter causing the death of twelve persons and the wounding of twenty, according to first reports. Great bitterness was caused in Greece by the murder of the Greek bishop of Grevena, and two priests and two attendants, who were found with their throats cut, outside the town. Some attributed the murder to the instigation of the Young Turk committee.

TURKS AND CAICOS ISLANDS. A dependency of the British colony of Jamaica; two groups of West Indian islands, having an area of 169 sq. miles and a population (census of 1911) of 5615. Principal island, and seat of government, Grand Turk, with (1911) 1681 inhabitants. The salt industry yields some 1,800,000 bushels annually. The imports and exports in 1910 were valued at £27,915 and £24,461 respectively; the revenue and expenditure were £8646 and £8827. A commissioner and acting judge (1911, F. H. Watkins) administers the dependency.

TURPENTINE, ARTIFICIAL. See **CHEMISTRY, INDUSTRIAL.**

TUSCALOOSA. See **ALABAMA.**

TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE. An institution for the training of colored young men and women at Tuskegee, Ala., founded in 1880 by Booker T. Washington. The number of students enrolled in the various departments of the school in 1911-12 was 1702. The faculty numbered 183. There were no notable changes in the faculty during the year and no noteworthy benefactions were received. In addition to its class-room and technical work, the institute engages widely in what may be termed extension work. This includes the annual negro conference with its numerous branches, publication of a weekly farm paper, a short course in agriculture, together with farm demonstration work supported by the United States government and the general education board, a county ministers' institute, and a national negro business men's league. There is great need for new buildings for the institute and plans have been drawn for these. Their construction awaits only the receipt of adequate funds. The amount of productive funds is about \$2,000,000. The equipment is valued at \$1,000,000. The president of the board of trustees is Seth Low, and the principal is Dr. Booker T. Washington.

TUTTLE, HIRAM AMERICUS. An American public official, formerly governor of New Hampshire, died February 10, 1910. He was born in Barnstead, N. H., in 1837. He was educated in the public schools and at Pittsfield Academy. After graduation he became a clerk in a clothing store and afterwards went into the same business for himself. In 1873-4 he was a member of the State House of Representatives, and from 1879 to 1883 was a member of the executive council. He was elected governor in 1891, serving until 1893. He had large real estate and lumber interests and was director in several financial institutions in New Hampshire.

TYPHOID FEVER. The phase of the typhoid problem which occupied the greatest attention during 1911 was prophylactic vaccination. The value of this measure having been definitely determined in the United States army by the voluntary inoculation of 7000 officers and enlisted men, General Wood made it compulsory. Before the end of the year the entire

army of 76,000 men was vaccinated with the "typhoid prophylactic" prepared by Major Russell of the Army Medical School in Washington, Secretary of War Stimson himself setting the example. Men over 45 years of age, and individuals known to have had an unmistakable attack of the disease, were exempted. The operation is similar to that of vaccination against smallpox, and causes little inconvenience, the soldier losing, as a rule, not a single day from duty. The subject is regarded as of the greatest importance by the army sanitarians. It was pointed out that in the Spanish War our troops developed 20,738 cases of typhoid fever, and that more than four-fifths of the total mortality was due to this disease. By way of contrast, the 16,000 troops recently mobilized in Texas during the Mexican revolution developed only one case of typhoid during the three months they were exposed to heat, dust, and flies. It is suggested that tourists, vacationists, physicians, nurses, and orderlies in hospitals—in short, all who are liable to contract or carry the disease—should submit to prophylactic vaccination.

Of equal importance, and perhaps greater interest to the average citizen, is the use of vaccines in the treatment of typhoid fever after it has developed. Meakins and Foster inoculated 41 patients in various stages of the disease, with very encouraging results. The average duration of fever was reduced by about nine days. The earlier vaccination was done, the better were the results obtained. In 17 cases vaccinated in the first two weeks of illness the average duration of fever was 17 days. A more striking illustration of the influence of the vaccination was apparent when an estimate was made of the number of days of fever after the treatment was begun. In 26 patients the temperature returned to normal in an average of five days after inoculation. Complications of a severe character, such as hemorrhages, perforation, cholecystitis, otitis media, periostitis, and phlebitis occurred in only 5 per cent. of the vaccinated cases; relapses were very infrequent, and the mortality was considerably reduced.

The problem of the bacillus "carrier" seems likely to be solved by the vaccination treatment. No certain method of curing these chronically infected individuals has as yet been discovered. While they are themselves in apparently perfect health, they continue for months to discharge large numbers of bacilli, and are a menace to all who live with them. It has been found that vaccination repeated at intervals has proved efficacious in eradicating the bacilli from several such "carriers" and the method promises to have an extensive use in the near future.

Albert has studied eighteen epidemics of typhoid traceable to "carriers." He finds that probably 5 per cent. of all typhoid patients become chronic "carriers"; 3 per cent. continued to excrete typhoid bacilli for more than one year after recovery; 25 per cent. of all chronic typhoid bacilli "carriers" have never had typhoid; one in every thousand of the general population is a "carrier," and 10 per cent. of all cases of typhoid are traceable to "carriers." Whenever there are household epidemics or a series of outbreaks of the disease in a given locality or an institution or among soldiers in the field, a "carrier" is the most probable source of infection.

Lumsden and Anderson published in December the results of what is "probably the most

patient and elaborate study of the epidemiology of typhoid fever hitherto made in the United States." This is the final report on the occurrence of causation of typhoid fever in the District of Columbia from 1906 to 1911. The investigators found that the disease cannot be traced to a single source, but that many factors influence its spread. The authors are convinced that the greater part of the typhoid infection in Washington is distributed through milk, green vegetables, and other foods, and by fingers and flies. Some of the infection is unquestionably derived from infected persons outside of the city, but the bulk of it is spread from the dejecta of typhoid fever patients and bacillus "carriers" within the city. For a full account of this most important investigation, see Bulletin 78 of the Hygienic Laboratory, United States Public Health and Marine Hospital Service, entitled *The Origin and Prevalence of Typhoid Fever in the District of Columbia*, by L. L. Lumsden and J. F. Anderson.

UGANDA PROTECTORATE. A British East African possession, covering an estimated area of 117,681 sq. miles and having between two and three million inhabitants. The British headquarters is Entebbe; the native capital, Mengo. The chief products and exports are ivory, skins, chillies, cotton, rubber, and ghee. The export of cotton has increased from 43 tons (£1089) in 1905-6 to 4148 tons (£165,412) in 1910-11. Imports (1910-11), £347,823 (cotton cloths, prints, groceries, etc.); exports, £306,609. A railway (between 40 and 50 miles) is in process of construction between Jinja (in Busoga) and Kakindu (below the Nile rapids). The so-called Uganda Railway lies wholly in the British East Africa Protectorate; connecting Mombasa, on the coast, with Port Florence, on Victoria Nyanza (584 miles). There are steamers on lakes Victoria, Albert, and Kioga. There is a telegraph line to Mombasa. The revenue and expenditure for 1910-11 are given at £191,094 and £252,347. Daudi Chua is king of Uganda. The governor and commander-in-chief is F. J. Jackson, appointed 1911. Vigorous measures are being taken by the administration against sleeping sickness, which has destroyed thousands of the population.

UHDE, FRITZ VON. A German painter, died February 25, 1911. He was born at Wolkenburg, Saxony, in 1848. His artistic studies were begun at the Dresden Academy in 1866, but finding the spirit of that institution uncongenial, he entered upon a military career and served in the army until 1877, when he again took up painting, giving his attention especially to the old Dutch masters. After unsuccessful attempts to gain admittance to the studios of Piloty and Diez in Munich, he was induced by Munkácsy in 1879 to remove to Paris, where he worked for a short time under this master. His principal studies, however, were from nature and from Netherland models. His first notable work was "The Family Concert" (1881). The new coloristic principles which he had meanwhile adopted are evident in the "Arrival of the Organ Grinder" (1883). After this date he turned to religious subjects and his "Suffer the Little Children to Come unto Me" exhibited at Munich in 1884, made a deep impression. This was increased by the paintings which followed in succeeding years, "The Last Supper" (1897), and "Come, Lord Jesus, and be our Guest" (1885). In the same year he produced "Christ

with the Disciples at Emmaus" in 1887, "The Sermon on the Mount"; in 1889, the triptych of the "Nativity," and in 1890, "The Walk to Bethlehem." Uhde gave rise to a complete change in German art by the evolution of his naturalistic conception. He counted among his followers most of the younger generation of painters. Among his best known pictures, in addition to those mentioned above, are "The Wise Men from the East" (1896), "The Ascension" (1898), and "Woman, Why Weepst Thou?" (1900).

UNEMPLOYMENT. UNITED STATES LEGISLATION: (a) *Public Employment Bureaus.* A considerable number of States enacted or amended laws designed to facilitate the finding of work by men seeking it. Indiana and Missouri established free public employment offices and the laws of Massachusetts, Michigan, and Montana with reference to public employment offices were extended. Indiana authorized the establishment of such an office under the direction of the State Bureau of Statistics in each city with 50,000 or more inhabitants. These offices are required to receive applications for all kinds of work, to keep a register of all applicants, to advertise for positions, and to make weekly and annual reports to the Bureau of Statistics. The Massachusetts law was amended by directing the superintendents of the employment offices to receive applications from alien immigrants seeking employment in agricultural labor, and otherwise to promote the distribution of immigrants to farming communities. The Massachusetts commission authorized to investigate the condition and management of employment agencies, public and private, was continued to January 10, 1912. Michigan increased the number of free bureaus from eight to ten. Missouri authorized the commissioner of labor to establish free bureaus in any city of 75,000 or more population. Montana amended its law by requiring first and second class cities to establish such offices, and permitted any other city to do so.

(b) *Private Employment Bureaus.* Illinois authorized a woman investigator of domestic agencies. Indiana required private agencies to pay an annual license fee, educational, professional, religious, or benevolent institutions being exempted in case no fee is charged. Kansas required private agencies to obtain licenses from the director of the State free bureaus, the license fee being \$25 in cities of 20,000 or over and \$10 in other cities. A bond of \$500 is also required to guarantee the observance of the law. Every private agency must keep a register; it cannot charge more than \$1 for registration unless wages exceed \$3 per day, when \$2 may be charged; the fee must be returned if no employment is secured within three days; false notices, promises, and entries are forbidden. Maine placed increased safeguards about the granting of licenses, raised the annual license fee from \$20 to \$25; required the keeping of a register in English; and in various ways limited the scope of private agencies. Minnesota allowed private agencies to extend their dealings to female and clerical help, and classified license fees and bonds according to whether male or

female help is provided. New Jersey transferred the granting of licenses from the mayor to the common council. Oregon passed a very extensive law regarding the licensing of shipping masters and the hiring of seamen. Pennsylvania safeguarded the granting of licenses by additional requirements permitting an agency to retain a fee of fifty cents when an honest attempt is made to secure a position for the applicant.

The *National Employment Exchange* organized in New York City in 1909 under the direction of Jacob A. Schiff and the Russell Sage Foundation published its second annual report in December. This exchange is divided into two departments, the mercantile and the manual. The mercantile department reported that 1331 persons had been placed, and the manual department that 1398 men had been placed. The exchange reported a difficult labor market from its standpoint, since the demand for labor in the city declined during the winter months at the very time when considerable numbers of workers previously engaged in canal construction and other work outside of the city were coming into the city seeking employment.

GREAT BRITAIN. A great deal of consideration has been given to the problem of unemployment by English statesmen and labor leaders in recent years. In no country has the problem been so acute. While the principal trade unions have been able to care for unemployed members in a very efficient manner, the great mass of unskilled laborers suffered great demoralization in the depression beginning in 1907. The first general policy adopted was the creation of a national system of labor exchanges (see below). Then followed in 1911 the creation of a government insurance scheme for the building and engineering trades. (See **WORKINGMEN'S INSURANCE.**) In addition there have been many efforts by the municipal authorities of the principal cities to care for their own unemployed by means of public works. There is still before the country the feasibility of extending the insurance scheme to include a much larger proportion of the workers; and the proposal to divert the unemployed of the cities to the rural communities to engage in agriculture and reforestation. A further constructive policy, which was suggested by the minority report of the poor law commission, was that training establishments be organized for the purpose of increasing the industrial efficiency of the unskilled unemployed.

One of the contentions of the workers made in the winter of 1907-08 was that, when willing, they should be given an opportunity to work. This doctrine was embodied in a bill introduced in Parliament by Keir Hardie in May and known as the Right-to-Work bill. This provided that anyone whose name was registered with a labor exchange might transfer his name to an employment register. When his name has appeared on this register a certain number of days and he has failed to secure work, the local authorities shall either provide work for him or maintain him and his family. The cost was to be divided between local and national budgets. One of the aims of this bill was to compel public works to be carried on at times of unemployment. It did not pass.

Labor Exchanges. Probably the most extensive experiment in the organization of labor exchanges was that begun in Great Britain in February, 1910, when eight-two exchanges were opened. The number of exchanges was gradu-

ally increased until by October, 1911, 239 exchanges were at work. For the administration of the system the country is divided into ten divisions in great Britain and one in Ireland. At the head of each is a divisional inspector. Sub-offices are opened in smaller towns and all of these are in communication with the divisional offices by telephone and telegraph; the divisional officers in turn maintain direct communication with the central clearing house of London. During the first nine months of 1911, 1,197,843 applications of men and women for employment were registered, and 324,270 vacancies filled. Of the applications, 156,361 were in the building trades; 140,586 in transportation; and 106,197 in engineering and machine making. There were 140,894 applications for out-door domestic labor, and 153,779 applications by general laborers. Between 80 per cent. and 85 per cent. of vacancies reported are filled.

One of the most contentious questions involved in the organization of labor exchanges was that raised by the trade unions as to whether the exchanges would be available to employers for the recruiting of strike breakers. There was much difference of opinion even in trade-union circles as to the neutrality of the exchanges during trade disputes. A considerable proportion of the time of the Trade Unions Congress at its annual meeting was devoted to a debate on this question. A resolution condemning the exchanges was carried by a vote of 1,097,000 to 273,000. Nevertheless in some places trade unions were using the exchange buildings for their meetings.

A proposal was made at the imperial conference in London in June, 1911, that the labor exchanges be utilized to recruit labor for the colonies. This proposition was not supported by the representatives from Canada, Australia, and South Africa, and was therefore withdrawn. Canadian opposition was especially strong, on the grounds that Canada prefers to select her immigrants, whereas the proposed plan would transfer the most shiftless and inefficient of British labor to the colonies. Nevertheless, various writers continued to point out that Great Britain was suffering greatly from her crowded slums, due in large part to unemployment, and that millions of acres in the colonies awaited cultivators.

GERMANY. The problem of unemployment has on the whole received most satisfactory solution in Germany up to the present time. The general principle upon which the problem has been attacked there is insurance through the co-operation of the public municipal authorities and the workers; sometimes by means of the trade unions. The following cities have some form of insurance against unemployment: Munich, Dresden, Cologne, Leipzig, Diüsseldorf, Mainz, Strassburg, Lübeck, Rostock, Carlsruhe, Elberfeld, Magdeburg, Cassel, Altenburg, Erlangen, and Wernigerode.

In Cologne the system has been in operation since 1896, when 100,000 marks was voluntarily subscribed by citizens, 25,000 marks was appropriated by the city, and the remainder of the fund ever since has been raised by assessments on insured workers. The fund is administered by a committee consisting of the mayor, the president of the labor exchange, twelve insured workers elected by the insured, and twelve honorary members chosen from prominent citizens.

In order to share in the insurance one must have a regular calling, have been a resident of Cologne for one year, be eighteen years old or over, and have paid a weekly contribution of thirty to forty pfennigs for at least thirty-four weeks. Insured persons out of employment between December 1 and March 1 receive two marks a day for twenty days, after their third day of unemployment, and one mark a day thereafter. Persons in ill health are cared for by the imperial insurance against sickness. In 1909-10 the number of insured was 1957. Of these 76 per cent. were out of work at some time during the winter and were paid 61,934 marks, although the total contributions of all insured was only 23,439 marks.

Similarly in Leipzig a group of private persons began the insurance scheme by a contribution of 100,000 marks. The city government did not contribute on account of socialist opposition; this was due to fear of competition with trade-union unemployment schemes. The insured in Leipzig are divided into four classes according as they contribute 7.5, 10, 12.5 or 15 cents per week throughout the year. Special provision is made whereby all employees of a firm or all members of a society may be insured as a body. The insured is eligible to a benefit of 1.2 marks per week during unemployment, after contributing for 42 weeks. In Strassburg there is direct coöperation between the municipal government and the trade unions. The government adds one mark per day to the benefit of two marks paid by the unions to unemployed members. There is close coöperation between the insurance and employment offices. In addition to the considerable number of municipal schemes the better organized trade unions pay large sums to employed members. Thus in Leipzig alone the trade unions pay their members an average of 5,000,000 marks annually in unemployment benefits. The result is that the worst effects of unemployment are quite uniformly prevented in Germany.

In spite of the fairly successful handling of the problem of unemployment by the municipalities and the trade unions, there is a wide agitation for the inauguration of an imperial scheme of insurance against it. The wider the scope and the greater the number of persons included, the more effective is the application of the insurance principle. Moreover, with an already well-organized system of labor exchanges national in scope, the machinery for testing the labor market, which an insurance scheme requires, is already at hand. See also **WORKINGMEN'S INSURANCE.**

German Labor Exchange. Germany has the most perfect system of labor exchanges of any country in the world. There are about 712 such exchanges in close coöperation by means of telephone and telegraph. In 1910 they registered 3,708,000 men and women. Employers offered 2,208,000 places, of which 1,524,000 were filled. The transactions had doubled since 1904. The railways, which are owned by the government, give low rates to men seeking work. The Berlin exchange is the most important. It has an advisory board of twenty-one members made up of representatives of employers, representatives of unions and apprentices, and members of the industrial court representing the unskilled. The annual running expenses are about \$25,000, of which \$10,000 is paid by the city

and the remainder is supplied by a five-cent registration fee. By the standardization of jobs and of qualities of workers the exchange has enlisted the support of both employers and workmen. The practice has become general for employers simply to telephone the exchange for so many men of a certain class or skill. The Berlin exchange is well housed, having three large apartments for skilled men, unskilled men, and women respectively. Preference is given to married men; and employers prefer union men. It is found that on an average a skilled union man need not wait longer than two weeks for a place. The time of waiting is longer for the unskilled. In close connection with the Berlin exchange is a municipal lodging house, at which from 3000 to 5000 men, women, and children may be lodged and fed every night.

STATISTICS. The British Board of Trade in January, 1911, issued a statement of the percentage of unemployed workers in various countries, based on trade-union reports. The returns for the United States were those published by the Massachusetts and New York labor departments. In the seven years 1903-09 inclusive, the average percentage of unemployed in Germany was 2.2; in France, 9.2; in the United States, 14; in Belgium, 3.1; in Denmark, 10; in Great Britain (ten-year average), 4.8. These statistics must be used with great caution. The fluctuations from year to year were found to be smallest in Germany and greatest in the United States. The statistics for the latter, however, were least comprehensive and representative of any.

UNION COLLEGE. An institution of higher learning at Schenectady, N. Y. The total number of students enrolled in 1911-12 was 340. The faculty numbered 32. Among the changes in the faculty were the following: Dr. George Dwight Kellogg, Ph. D., was appointed to the chair of Latin language and literature, left vacant by the death of Sidney G. Ashmore (q. v.); Morton Collins Stewart was made assistant professor of German. A special graduate course was established, with electrical science as major, leading to the degree of Ph. D. A wireless telegraph outfit and experiment station was set up during the year in connection with the electrical laboratory.

UNITARIANS. A Protestant religious denomination, the distinctive feature of which is the acceptance and adoption of the principles of freedom and progress in religious thought. The administrative body of the church is the American Unitarian Association, which has headquarters in Boston. There are no official statistics of the membership of the denomination, but in 1911 it was approximately as follows: Communicants, 70,542; churches, 482; ministers, 558. The denomination maintains a large number of conferences, unions, alliances, and leagues, organized for the purpose of distributing Unitarian literature and Unitarian thought throughout the world. The church has considerable strength in Great Britain, where there are 375 ministers and 372 congregations. Divinity schools are maintained at Cambridge, Mass., Meadville, Pa., and Berkeley, Cal. The denomination carries on missionary work at many points, among the Icelandic, Norwegian, and Swedish immigrants in the United States. Field secretaries are employed in New England, New York, Canada, and on the Pacific coast. Among the most important of the Unitarian

publications are the *Christian Register*, published in Boston, the *Unitarian Advance*, published in New York, and the *Pacific Unitarian*, published in San Francisco. President of the American Unitarian Association, Rev. Samuel A. Eliot; secretary, Rev. Lewis G. Wilson.

UNITED BRETHREN. See MORAVIANS.

UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA. A Protestant religious denomination which was formed in 1858 at Pittsburgh, Pa., by union of Associate and Associate Reformed churches. According to statistics gathered by the denomination there were in 1911 176,682 communicants, of whom 35,693 were in the foreign missionary fields. There were 1150 ministers and 1112 churches. In the 1402 Sabbath schools there were 195,906 scholars and 15,869 officers and teachers. There were 964 Young People's societies, with a membership of 32,657. The total contributions for all purposes for the year amounted to \$2,610,045. Of this amount \$801,324 was for salaries of ministers, \$957,607 for congregational purposes, \$592,361 for the boards of the church, and \$231,836 for general purposes. The average salary of pastors in the denomination in America was \$1234. Under the auspices of the denomination are six colleges in the United States, one at Assiut, Egypt, and one in the Punjab, India. The theological seminaries are at Allegheny, Pa., and Xenia, O. The property value of these institutions is about \$900,000. The church carries on missions in Egypt, India, and the Sudan. Home missions are maintained among the mountaineers of Kentucky and Tennessee, and among the negroes in Virginia, Tennessee, Alabama, and Mississippi, and the American Indians in the Oregon and Idaho reservations. The leading papers of the denomination are the *United Presbyterian* and the *Christian Instructor*, and there are several other periodicals for Sabbath schools and young people issued from the publishing house in Pittsburgh, Pa. The church is a member of the World's Alliance of Presbyterian and Reformed Churches, the Council of the Reformed Churches in America, and the Federation of the Evangelical Churches in America. An active part is taken in the Men and Religion Movement and general Christian work. The General Assembly meets annually in May.

UNITED STATES. AREA AND POPULATION. The area of the United States, including continental United States and the territories under its jurisdiction, is estimated by the United States Coast and Geodetic Survey at 3,743,344 sq. miles, divided as follows: United States, 3,026,789; Alaska, 590,884; Philippine Islands, 115,026; Hawaiian Islands, 6449; Porto Rico, 3435; Isthmian Canal Zone, 474; Guam, 210; Tutuila group, Samoa, 77. The population of the United States, according to the Thirteenth Census, taken in 1910, is 91,972,266. This includes all non-contiguous territories, with the exception of the Philippine Islands, Guam, and Tutuila, in which the census was not taken. The populations of the different States will be found in the articles on the States.

AGRICULTURE. Statistics relating to agriculture in general will be found in the articles dealing with agriculture and agricultural products. The agricultural production of the different States and the non-contiguous territories will be found under their respective headings.

INDUSTRIES. The industries of the United

States are discussed in general in the articles dealing with those industries, as IRON AND STEEL, COTTON, RAILWAYS, SHIPBUILDING, TEXTILE MANUFACTURES, BOOTS AND SHOES, etc. For matters relating to the operation of manufactures and industries, see TAXATION, TRADE UNIONS, TRUSTS, FINANCIAL REVIEW, etc.

MINERAL PRODUCTION. A summary of the mineral production of the United States in 1910 will be found in the table in the article MINERAL PRODUCTION. The production of different minerals and metals in 1910 and in 1911, so far as available, is given under the respective headings of these articles, as ALUMINUM, COAL, IRON AND STEEL, GOLD, SILVER, ETC.

EDUCATION. For an account of the progress of educational matters in the United States in 1911, see the article EDUCATION IN THE UNITED STATES. For notes of educational development in the different States, see paragraph *Education* in those States.

RELIGION. An account of changes and growth during the year in the various churches will be found in the articles on the respective denominations. See also the summary under the title RELIGIOUS DENOMINATIONS.

FOREIGN COMMERCE

The tables shown below give a summary of the foreign commerce of the United States in the fiscal and the calendar years 1910 and 1911. In Table 1 are shown the total value of the imports and exports for the calendar years 1910 and 1911, with the principal countries of origin. Table 2 shows the foreign imports and exports, with their countries of origin in the fiscal years 1909, 1910, and 1911. Tables 3 and 4 show the chief articles of import and export in the fiscal years 1910 and 1911. From the table dealing with the imports and exports of the fiscal year it will be seen that in the year ending June 30, 1911, the total imports amounted to \$1,527,226,105, as compared with \$1,556,947,430 in 1910. The exports were \$2,049,320,199 in 1911, as compared with \$1,744,984,720 in 1910. Thus, while the figures for imports show a decrease in 1911, there was shown a considerable increase in exports. There were losses in imports from all the grand divisions except Asia, Oceania, and Africa. The imports from Europe declined

from \$806,270,280 in 1910 to \$768,167,760 in 1911. From the countries of North America there was a decrease of over \$100,000 in imports. From the South American countries the imports declined from \$196,164,786 in 1910 to \$182,623,750 in 1911. The imports from Asia and Oceania increased from \$230,255,139 in 1910 to \$243,724,182 in 1911. Those from African countries increased from \$17,489,739 in 1910 to \$27,213,620 in 1911. The exports in the fiscal year 1911 showed an increase in all the grand divisions. To Europe the increase was from \$1,135,914,551 in 1910 to \$1,308,275,778 in 1911; to the countries of North America from \$385,520,069 to \$457,059,179; to South American countries from \$93,246,820 to \$108,894,894; to Asia and Oceania, from \$111,751,900 to \$151,489,741 in 1911; to Africa, from \$18,551,380 in 1910 to \$23,600,607 in 1911.

The foreign commerce of the United States in the calendar year 1911, when compared with that of 1910, shows a considerable increase and a larger total than in any earlier year in the history of the commerce of the country. Imports, while falling below those of 1910 in the earlier months of the year, in the closing period showed a marked increase and differed but little from those of 1910, which made the highest record in the history of the import trade. Exports were larger than in any earlier year, amounting to \$2,092,526,846. The imports were \$1,533,067,130, leaving an excess of exports over imports of \$559,459,716. Considering the great groups of articles, the noteworthy changes were, in the case of imports, a falling off in manufacturers' raw materials and in finished manufactures; and in the case of exports a general increase participated in by all the important groups, foodstuffs, manufactures, and manufacturers' materials.

The exports of manufactures in the calendar year exceeded \$1,000,000,000; those sent to foreign countries amounted to \$964,773,968; to Porto Rico, \$21,860,137, and to Hawaii, \$15,337,758, making a total of \$1,001,972,863. Exports of manufactures from the United States have more than doubled in ten years and quin-

TABLE I
IMPORTS AND EXPORTS, CALENDAR YEARS 1910 AND 1911

Countries	Imports		Exports	
	1910	1911	1910	1911

tupled in twenty years. In 1891 they aggregated \$190,000,000; in 1901, \$447,000,000, and as seen above, in 1911, over \$1,000,000,000. The four leading articles of domestic manufacture, iron and steel, copper, mineral oil, and wood, supply over half the entire exportations of manufactures from the country, and to them the gain of over \$500,000,000 in ten years is largely due.

American manufactures are sold in all parts of the civilized world. In 1911 the exports

of agricultural implements from the United States to Russia aggregated \$7,273,203; those to Canada and Argentina, each about \$6,000,000; to Germany, \$2,378,953, and to France, \$3,088,298. About three and one-third million dollars' worth of automobiles went to the United Kingdom in 1911 and nearly double that sum to Canada. Mexico, Cuba, and Argentina, as well as Canada, took large amounts of railway equipment, the value of freight and passenger cars alone sent to each of those countries rang-

ing from \$1,000,000 to \$2,500,000. Europe took nearly \$1,250,000 worth of American clocks and watches in 1911, and Canada an almost equal amount. The growing exports of copper pigs are mostly sent to the industrial countries of Europe. All grand divisions and practically all important countries are represented in the 1911 high record exports of iron and steel in their numerous forms—rails, typewriters, structural forms, cash registers, adding machines, locomotives, sewing machines, windmills, printing presses, etc. Cuba, Canada, and Great Britain offer large and growing markets for our boots and shoes.

In round numbers the exports of the principal classes of commodities in the calendar year 1911, in addition to iron and steel, were as follows: Raw cotton, \$577,000,000; meat and dairy products, \$160,000,000; breadstuffs, \$136,000,000; oils, \$132,000,000; copper pigs, ingots, etc., \$98,000,000; wood and manufactures, \$96,000,000; leather and manufactures, \$57,000,000; tobacco and manufactures, \$47,000,000. In imports of 1911 sugar stands at the head, with approximately \$100,000,000. Other values are as follows: Silk and manufactures of silk, \$99,000,000; coffee, \$97,000,000; cotton manufactures, \$68,000,000; wood and manufactures of wood, \$52,000,000; manufactured fibres, \$56,000,000; India rubber and manufactures, \$89,000,000; and raw wool, \$25,000,000.

TRADE WITH SOUTH AMERICA. Trade between the United States and South America in the calendar year 1911 was practically \$300,000,000 in value, a total in excess of that of any earlier year. In 1900 the trade between the United States and that continent aggregated \$144,000,000; in 1905, \$211,000,000; in 1910,

\$290,000,000; and for the calendar year 1911 a total of fully \$300,000,000.

TABLE III

CHIEF ARTICLES OF IMPORT, FISCAL YEARS 1910 AND 1911

Articles	Imports	
	1910	1911
Art works.....	\$ 21,008,720	\$22,495,842
Automobiles	2,851,446	2,250,759

Manufactures of	33,397,097	40,851,918
Unmanufactured	450,447,243	585,318,869
Fertilizers	8,700,640	10,721,132
Fish	9,652,088	7,698,321
Fruits, including nuts.....	18,885,654	24,498,465
Iron and steel, and manu- factures of, not including ore	179,133,186	230,725,351
Leather, and manufact's of	5,646,755	53,673,057
Mineral oils	99,090,212	98,115,516
Meat and dairy products....	130,632,783	149,389,737
Naval stores	18,681,962	25,022,720
Oil cake and oil cake meal†	19,251,012	19,631,121
Paper, and manufactures of	16,083,271	19,215,499
Paraffin and paraffin wax..	7,886,359	7,378,736
Seeds	3,485,418	2,475,066
Tobacco:		
Manufactures of.....	4,803,101	4,383,584
Unmanufactured	38,115,386	39,255,320
Vegetable oils.....	16,479,301	19,805,232
Wood, and manufactures of.	78,813,803	92,256,951

† Not including corn oil cake.

Imports from South America still exceed exports to that continent, though the latter are rapidly gaining in the proportion which they form of the total trade. In 1900 imports were valued at \$103,000,000, exports at \$41,000,000, exports thus being 29 per cent. of the total trade. In 1911 imports were \$187,434,966 and exports \$121,736,604, the latter being 40 per cent. of the total trade.

The imports into the United States from South America are chiefly drawn from the following countries: Brazil, \$103,464,111; Argentina, \$28,446,296; Chile, \$20,230,436; Colombia, \$9,894,431; Peru, \$8,960,895; and Venezuela, \$8,673,489. From Ecuador the year's imports are a little over \$3,000,000; from British Guiana, a little less than \$2,000,000, and from Dutch Guiana about \$1,000,000.

Exports to South America, on the other hand, show a marked growth when compared with those of a year earlier, the total for 1911 being \$121,736,604, compared with \$100,303,616 in 1910, the former high record year. To Argentina, the largest South American market for American products, our exports increased from \$42,750,000 in 1910 to a total of \$50,000,000 in the year just ended; to Brazil, from \$25,000,000 to \$28,000,000; to Chile, from \$10,000,000 to \$15,000,000; to Peru, from less than \$5,000,000 to practically \$6,000,000; to Uruguay, from \$4,500,000 to \$5,500,000; to Venezuela, from \$3,000,000 to \$4,000,000; and to Colombia, from \$4,666,000 to a little over \$5,000,000.

COMMERCE WITH NON-CONTIGUOUS TERRITORIES. The total value of domestic merchandise shipped to non-contiguous territories of the United States, which includes Alaska, Hawaii, Porto Rico, and the Philippine Islands, in the calendar year 1911 was as follows: Alaska, \$14,693,588; in 1910, \$16,822,732; Hawaii, \$21,917,747; in 1910, \$21,637,751; Porto Rico, \$35,872,109; in 1910, \$30,565,023; Philippine Islands, \$20,896,029; and in 1910, \$19,856,828. Imports to the United States from non-contiguous territories in 1911 were as follows: Alaska,

\$19,318,859; Hawaii, \$48,086,991; Porto Rico, \$35,446,186; Philippines, \$20,212,917.

INTERNAL COMMERCE

LIVESTOCK AND GRAIN MOVEMENTS. The commercial movement of livestock in 1911 as measured by receipts of food animals at seven primary interior markets showed an increased volume as compared with 1910. Large gains were shown in the receipts of hogs and sheep. The supply of cattle, on the other hand, fell about half a million head short of the total for 1910. As compared with the five-year average supply for the period 1906 to 1910, the receipts of cattle in 1911, 8,768,546, showed a decline of 5 per cent., and those of hogs, 20,806,479, an increase of 8 per cent. The large gain of sheep shown in 1910 continued in 1911, the total, 13,556,108, exceeding the average for 1906 to 1910 by about 27 per cent.

Grain receipts at 16 leading interior markets for 1911 amounted to 80,445,665 bushels, compared with 82,929,554 bushels in 1910. The aggregate was made up of 262,639,188 bushels of wheat, 254,466,168 bushels of corn, 197,318,369 bushels of oats, 76,380,150 bushels of barley, and 9,621,790 bushels of rye. Flour shipments from 13 leading milling centres were about 13 per cent. below those of 1910, or 36,379,969 barrels. The loss affected chiefly Chicago, Duluth, Milwaukee, and Kansas City.

LUMBER MOVEMENTS. The movements of lumber during 1911 showed but little change from the depressed condition of trade indicated in 1910. The stationary condition in building, especially in the larger cities of the East and the substitution of iron and steel for wood, are partly accountable for the unsatisfactory traffic return. In the North and Central West the gradual exhaustion of the supply of timber is another important factor in curtailing the market supply of lumber. The rail shipments of pine lumber from the territory in the Mississippi and Wisconsin valleys, as reported by the Northern Pine Manufacturers' Association, shows a total of 1,258,079,432 feet, as against 1,186,039,886 feet in 1910.

COAL MOVEMENTS. The volume of coal traffic during 1911, as reported by the leading Eastern coal-carrying railroads, showed but little change from 1910. Coke, on the other hand, showed a considerable decline. The anthracite coal shipments from the Eastern producing territory aggregated during 1911 69,954,299 long tons, the largest annual total recorded in ten years, and exceeding by over 5,000,000 long tons the high record of 1910. Movements of bituminous coal, as reported by 12 Eastern coal-carrying roads, totaled 114,623,992 short tons in 1911, as compared with 141,901,017 short tons in 1910. The Lake shipments of soft coal in the year, 17,081,355 short tons, showed a considerable shrinkage from the 1910 figures of 18,405,469 short tons. This resulted in a measure from the coal strike which increased the demand for coal at the upper Lake ports.

LAKE COMMERCE. The volume of Lake commerce in 1911, as measured by the quantity of merchandise shipped between domestic Lake ports, showed a decline of 15 per cent., or from 86,732,316 short tons in 1910 to 74,311,019 short tons in 1911. The loss was due mainly to the lighter eastward movement of iron ore. The principal gains were in grain, hard coal,

and miscellaneous freight. Domestic shipments of iron ore to Lake Michigan and Lake Erie ports fell more than 10,000,000 short in 1911 from the shipments of 1910, while the shipments of soft coal, 17,081,355 short tons, fell about one and one-third million tons short of the 1910 total. The shipments of hard coal, mainly from Buffalo, Erie, and Oswego, showed a normal increase during 1911, the total, 4,374,100 short tons, exceeding that of any previous year. Lake shipments of lumber in 1911 showed a slight decline from the figures of 1910. The decline affected shipments from Lake Erie and Lake Huron ports, while those from Lake Michigan ports showed a slight increase. Grain and flaxseed shipments during the year, 133,894,362 bushels, showed an increase over the figures of 1910. Flour shipments for the year, 1,152,807 short tons of 10 barrels each, showed but little change from the figures for 1910. Lake shipments of copper, mainly from Lake Superior ports, 142,075 short tons in 1911, showed a decline of 15 per cent. from the figures for 1910, and the lake movement of pig iron, iron manufacturers, and salt showed even larger declines. In unclassified freight, however, there was a considerable increase.

The movement of vessels in the domestic Lake trade showed a decline from 1910 of 110,292-481 net tons register to 103,601,550 in 1911. The average size of the Lake vessels engaged in the domestic Lake trade was 1331 net tons, compared with 1452 net tons in 1910.

RIVER AND CANAL TRAFFIC. Data regarding transportation on rivers and canals in the country reflect the total traffic movement in a very imperfect manner. This is especially true of the statistics of commercial movements on the Mississippi River, which are reported from a few points only. The vessel movement at Cairo, Ill., at the confluence of the Mississippi and Ohio rivers showed 7149 arrivals and a combined tonnage of 3,947,337 tons, of which 5045 arrivals, comprising 3,284,842 tons, represented the movement of boats and barges, and 2104 arrivals, comprising 662,495 tons, the movement of steamers. The Erie Canal tonnage for the year, 2,031,735 short tons, as well as the freight tonnage for all New York State canals, 3,097,068 short tons, showed but little change from the low figures of the two years preceding. The movement of grain and grain products by these canals aggregated 314,476 short tons, the lowest annual total recorded by the New York State authorities.

COINAGE. The coinage executed at the mints of the United States during the years 1910 and 1911 was as follows:

Denomination	1910	
	Pieces	Value
Double eagles.....	1,819,600	\$36,392,000.00
Eagles.....	586,695	5,866,950.00
Half eagles.....	2,403,639	12,018,195.00
Quarter eagles.....	759,871	1,899,677.50
Total gold.....	5,569,805	\$56,176,822.50
Half dollars.....	3,373,623	\$1,686,811.50
Quarter dollars.....	5,642,143	1,410,535.75
Dimes.....	33,599,543	3,359,954.30
Total silver.....	42,615,309	\$6,457,301.55
Five cents.....	39,559,372	\$1,977,968.60
One cent.....	117,875,787	1,178,757.87
Total minor.....	157,435,159	3,156,726.47
Total coinage.....	205,620,273	\$65,720,850.52

Coinage for Philippine Islands' government:

Silver—Pesos.....	463,000	pieces
20 centavos.....	505,000	"
10 centavos.....	1,000,505	"
Total.....	1,968,505	"
Bronze—1 centavo.....	4,803,800	"

Coinage executed for the republic of San Salvador: Silver—peso pieces, 1,968,505 pesos.

RECEIPTS AND DISBURSEMENTS. The following table, compiled from figures given by the Secretary of the Treasury, shows the receipts and disbursements of the federal government for the fiscal years 1910 and 1911:

RECEIPTS		
	1910	1911
Customs.....	\$333,683,445.03	\$314,497,071.24
Internal revenue:		
Ordinary.....	268,981,738.48	289,012,224.20
Corporation tax.....	20,951,780.97	33,616,978.59
Sales of public lands.....	6,355,797.49	5,731,636.88
Miscellaneous.....	45,538,953.05	58,614,466.08
Ordinary receipts.....	\$675,511,715.02	\$701,372,374.99
Panama Canal receipts.....	18,102,170.04	18,102,170.04
Public debt receipts.....	31,674,292.50	40,232,555.00
Total, exclusive of postal.....	\$707,186,007.52	\$759,707,100.03
Postal revenue.....	224,128,657.62	237,879,823.60
Total incl. postal.....	\$931,314,665.14	\$997,586,923.63
* Proceeds of bonds.....		
DISBURSEMENTS		
	1910	1911
Civil and miscellan.....	\$171,580,829.79	\$173,838,599.04

Total, exclusive of postal.....	\$726,666,759.95	\$726,424,849.57
Postal expenditures.....	224,128,657.62	237,879,823.60
Total, incl. postal.....	\$950,795,417.57	\$964,085,555.05
Deficit.....	19,480,752.43	
Excess of receipts.....		33,501,368.58

The receipts and disbursements for the fiscal year ending June 30, 1912, are estimated by the Secretary of the Treasury in his annual report as follows:

RECEIPTS	
Customs.....	\$296,000,000
Internal revenue.....	165,000,000
Corporation tax.....	25,000,000
Miscellaneous.....	55,000,000
Total ordinary receipts.....	\$666,000,000
DISBURSEMENTS	
Civil establishment.....	\$172,000,000
War Department.....	165,000,000
Navy Department.....	125,000,000
Indian service.....	17,000,000
Pensions.....	154,000,000
Interest on the public debt.....	22,775,000
Total ordinary disbursements.....	655,775,000
Surplus for 1912 in ordinary receipts.....	10,225,000
Panama Canal disbursements.....	45,000,000
Miscellaneous redemptions of the public debt.....	150,000
Total estimated deficit.....	\$ 33,189,104

CIRCULATION. The following table shows the general stock of money in the United States on January 2, 1912, the amounts held in the treasury as assets of the government on that date, and the money in circulation on the same date and on January 2, 1911:

building for the Department of Justice, \$1,900,000, and the building for the Department of Commerce, \$3,650,000. The largest of the buildings is to be that of the Department of Commerce and it will stand between the other two. The whole group of buildings will occupy

	General stock Jan. 2, 1912	† Held in Treas. Jan. 2, 1912	Money in circulation	
			Jan. 2, 1912	Jan. 2, 1911
Gold coin (including bullion in Treasury)	\$1,797,000,916	\$172,017,641	\$614,026,906	\$605,650,087
* Gold certificates		104,012,002	906,944,367	849,174,639
Standard silver dollars	565,186,367	1,481,776	74,538,591	75,794,419
* Silver certificates		11,138,716	478,027,284	474,333,499
Subsidiary silver	165,789,312	18,016,294	147,773,018	142,462,703
Treasury notes of 1890	3,093,000	14,386	3,078,614	3,461,493

National bank notes	740,603,187	35,366,945	705,236,242	704,091,292
Total	\$3,618,353,798	\$350,778,476	\$3,267,575,822	\$3,192,280,286

Population of continental United States January 2, 1912, estimated at 94,808,000; circulation per capita, \$34.47.

* For redemption of outstanding certificates an exact equivalent in amount of the appropriate kinds of money is held in the treasury, and is not included in the account of money held as assets of the government.

† This statement of money held in the treasury as assets of the government does not include deposits of public money in National Bank depositaries to the credit of the Treasurer of the United States, amounting to \$36,151,904.37.

For a full statement of assets see Public Debt Statement.

NATIONAL DEBT. The amount and classification of the United States national debt at the end of the calendar years 1909, 1910, and 1911 were as follows:

	Dec. 31, 1909	Dec. 31, 1910	Dec. 31, 1911
Interest-bearing debt at from 2 to 4 per cent. and redeemable from 1907 to 1925 inclusive	\$ 913,317,490.00	\$ 913,317,490.00	\$ 963,359,390
Debt on which interest has ceased since maturity	2,365,725.26	1,995,045.26	1,821,830
Debt bearing no interest	380,537,483.78	387,919,402.43	379,794,799
Gross debt	\$1,296,220,699.04	\$1,303,231,937.69	\$1,344,976,020
Cash balance	84,048,865.69	59,393,472.14	126,925,992
Net debt	\$1,212,171,833.35	\$1,213,838,465.55	\$1,218,050,138

DISTRICT OF COLUMBIA. The Thirteenth Census included statistics of agriculture for the District. These are for April 15, 1910. On that date there were 217 farms, compared with 269 in 1900. The land in farms was 6063 acres. The improved land in farms was 5133 acres. The average acreage per farm was 279. The total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$8,476,533, compared with \$11,535,376 in 1900, a decrease of \$3,058,843 in the decade. The average value of all property per farm was \$39,082, compared with \$42,882 in 1906. The average value of land per acre was \$1186, compared with \$1142 in 1900. The farms operated by owners and managers numbered 133, and those operated by tenants, 84. Of the farms operated by owners 93 were free from mortgage and 21 were mortgaged. The native white farmers numbered 168; foreign-born, 37; negro and other non-white, 12. The value of domestic animals of all kinds was \$152,840. The cattle numbered 982, valued at \$75,305; horses and colts, 564, valued at \$55,026; mules, 53, valued at \$5860; swine, 665, valued at \$9382; poultry of all kinds numbered 8349, valued at \$6477.

In April, 1911, the government made the assignment of commissions for the erection of three new department buildings, the State, Justice, and Commerce buildings. This award is the largest and in some respects the most important ever offered in the United States. The State Department building is to cost \$2,200,000; the

the area bounded by Pennsylvania Avenue, the Mall, and Fourteenth and Fifteenth streets. The two end buildings are to be three stories high and the Commerce building five stories. The structures are to be of white marble, thus harmonizing with the wings of the Capitol, the new House and Senate office buildings and the new District of Columbia building. In the State Department building there will be an international conference room, a reception room, and a large state dining room. In the Justice building there will be a large law library. Successful competitors for designs of the buildings were Arnold W. Brunner for the State building, Donn Barber for the Justice building, and York & Sawyer for the Commerce building.

ARMY

The authorized strength of the regular army at the end of the fiscal year 1911 was 77,523 enlisted men and 4848 officers, an increase of 395 officers and 612 enlisted men over the preceding year. In addition the authorized strength of the Philippine Scouts was 5732 enlisted men and 180 officers, the same as in 1910. The actual strength of the regular army on October 15, 1911, the latest date for which statistics are available, was 70,250 enlisted men and 4388 officers, an increase over the preceding year of 78 officers and 2791 men. In addition to these the actual strength of the Philippine Scouts on that date was 173 officers and 5442 enlisted men, an increase over 1910 of 7 officers and 742 men. The geographical distribution of

the army, including the Philippine Scouts, is shown in the following table:

In the United States.....	56,753
In Alaska	1,084
In the Philippines:	
Of the regular army.....	11,583
Philippine Scouts.....	5,615
In Porto Rico	600
In Hawaii	2,332
In the Canal Zone.....	854
Troops en route and officers in foreign stations	1,432

During the fiscal year 1911 Congress enacted legislation for the creation of additional officers, 12 of whom are to be engineers and 60 dental surgeons, while 200 are for the purpose of meeting the drain caused by officers necessarily on detached duty, particularly for the instruction of the militia. Inasmuch as the graduating class from the Military Academy and those commissioned from among the enlisted men were quite insufficient to fill the already existing vacancies, many of the new officers must be appointed from civil life. Great care has been taken in prescribing the requirements of the examinations of these officers in order to raise, if possible, the standard of admission and to hold out special inducements to the educated men of the country, graduates of colleges and universities, to enter the military service. One examination was held in 1911, but the results had not been published at the end of the year.

PERSONNEL. The Secretary of War in his annual report notes a distinct improvement in the personnel of the army, both officers and men. This he believes is due largely to the influence of the army schools, which have broadened the outlook and distinctly raised the tone of the army at large and engendered a high sense of duty and a sense of self-sacrifice. He points out the great need of a fair merit system; governing both promotion and elimination of officers. As a result of the present system of elimination for unfitness, there is much deadwood in the army, and the secretary expresses the desire to bring about a more rational treatment of their duties of the examination and retirement boards to the end that these unfit officers may be eliminated.

ENLISTMENT AND DESERTION. Recruiting for the army proceeded satisfactorily throughout the year and the Secretary of War reports the character of the men enlisted gratifyingly good. The actual strength of the army on October 15, 1911, was about 9 per cent. below its authorized strength. About 72 per cent. of the whole number of applicants for enlistment were rejected. The number of desertions during the fiscal year fell from 4993 and 3464 for the two preceding years to 2504, or 2.28 per cent. of the whole number of enlisted men in the service during the year. This is the lowest percentage of desertion that has obtained in the American army, with one exception, during the past ninety years.

HEALTH AND SANITATION. One of the most striking achievements ever accomplished by the medical corps of the army was the demonstration which it made during the fiscal year 1911 of the value of the typhoid prophylaxis. In this particular branch of preventive medicine the physicians of the regular army are leading the progress of the medical world. As soon as orders were issued for the mobilization in Texas

pating should receive the prophylactic treatment. The results of this measure were remarkable. During the mobilization about 16,000 men were concentrated in military camps in the country, certain portions of which were infected with typhoid fever. During the first four months of the encampment in Texas 49 cases of typhoid fever occurred in the city population of San Antonio and 192 in Galveston. In the army camp typhoid fever was practically absent, there being only three cases in the whole camp, two in San Antonio and one in San Diego. Of these cases one was that of a teamster who had evaded the inoculation. Not a single case occurred in Galveston or at the numerous camps along the Mexican border.

MILITARY OPERATIONS. The most noteworthy military activity of the year was the mobilization of the troops in Texas, where for several months large bodies were engaged in assisting the civil authorities in the enforcement of the neutrality laws on the Mexican border. Conditions indicating a serious unrest and intrigue on both sides of the border led to the stationing of two cavalry troops along the frontier of Texas in November, 1910. These were augmented as necessity required until the entire border line from the mouth of the Rio Grande in Texas to San Diego in California was patrolled by United States troops. In March, 1911, a division of troops was concentrated at San Antonio, Tex., for the purpose of manoeuvres and to render the civil authorities any aid that might be required to secure the proper observance and enforcement of the neutrality laws on the Mexican border. A separate brigade was mobilized at Galveston, Tex., and a partial brigade at San Diego, Cal. This movement involved the transportation of about 16,000 troops in various posts all within the continental limits of the United States, and it was accomplished practically without unnecessary delay. The return of these troops to their regular stations began on June 15, 1911, with the discontinuance of the second brigade and continued gradually until August 7, when the manoeuvre division was discontinued, the troops then remaining consisting of a regiment of cavalry, three regiments of infantry, a company of engineers, and a company of signal corps being temporarily attached to the Department of Texas. The experiences derived from these manoeuvres were of great value and importance to the army. See below, *Foreign Relations*.

ARMY ORGANIZATION. Plans for reorganizing the army administration have long been under consideration by successive secretaries of war and other officials. Under the present system, which is the same as when the army numbered only 25,000 men, the effective force of the United States is distributed among 49 army posts in 24 States and Territories. Of these posts 31 have a capacity for less than one regiment each, only six have a capacity for more than a regiment and but one a capacity for a brigade. The average number of organizations to each of the 49 posts is only 9 companies, giving an average strength of men for each post of but 650. Nearly all these posts were assigned to their present situations for reasons which are now either totally obsolete or which from the beginning were purely local. Many of them were the result of trouble among the Indians in the West. The result of this distribution is an arrangement which is extremely

expensive to maintain and one whose efficiency for the main purpose of its existence is nullified so far as its geographical location can nullify it. In addition the administrative work in keeping up these numerous small posts adds greatly to the expenses. It is estimated that the United States government pays per effective rifleman between two and five times as much as any first-class power on the continent of Europe, even after excluding from the comparison the higher pay and subsistence which American soldiers receive.

The reorganization of the army on the basis of larger tactical units and the rearrangement of garrisons with this in view has been urged for many years. The necessity of establishing forces in Hawaii and on the Isthmus of Panama, as well as for other purposes, makes reorganization even more imperative. Thoroughly to reorganize the military establishment, the Secretary of War estimates, would involve much legislation and would encounter many serious difficulties. Nevertheless, steps have been and are being taken to correct as far as possible these faults of organization. Among these steps are the following: The United has been divided for administrative purposes into three territorial divisions which now perform the administrative functions formerly performed by seven departments. This change went into effect July 1, 1911. It has already resulted in an estimated saving of \$240,000 per annum. The department commanders, having been freed from the administrative work formerly performed by them, are now able to devote their time to the personal inspection, training, and supervision of the troops within their departments. The second change is in the redispersion of certain regiments. Several regiments of cavalry hitherto situated in the far north, where for many months in the year it was practically impossible for cavalry to drill outdoors, have been transferred to the Southwestern States. This was due in the first instance to the mobilization of the troops along the Mexican border, but these regiments will, as far as possible, continue to be maintained in this part of the country, while the infantry will be substituted for them in the northern posts. Third, steps have been taken to raise to maximum strength the company units of the forces in the foreign service, while the regiments on the continent of the United States continue to be of smaller size. This increase in the company units will raise the effective infantry and cavalry garrisons in the Philippines to 8592 men, as against 7536 under the present system. It will produce an economy in the maintenance of that garrison in pay alone \$1,000,000 per year. It will also reduce the cost of construction of permanent barracks and quarters in the islands and it will relieve for use in the United States or elsewhere six regiments, four of infantry and two of cavalry.

The question of the term of enlistment has received much consideration. Two opinions are held among officers of the army and others. One of these advocates the present term of three years for enlisted men, while the other believes that the term of service should be shortened to less than three years so as to allow as many men to go through the training of the regular army as possible, but that some hold should be retained over the discharged

soldier after he returns to civil life by which he can be recalled to the colors in case of war. The latter theory is the one advocated by Secretary Stimson. Bills to bring about this and other reforms in the organization of the army were introduced in Congress, but no action had been taken by the end of 1911.

COUNCIL OF NATIONAL DEFENSE. A bill was introduced in Congress and was favorably reported by the House committee on naval affairs to establish a council of national defense. The duty of this council is to make practicable the formulation and execution of a consistent and continuing policy of national defense, to help in coordinating the plans of the army and navy and furnish a means of coordinating military and financial questions before submitting to the President and Congress recommendations for measures of national defense.

NATIONAL VOLUNTEERS. A bill was pending before Congress at the end of the year to provide an organization of national volunteers. It is intended that this body shall be called out if necessary after the organized militia has been mustered in. These volunteers are intended to be distinct from the militia, which are under the control of the various States, and are to be under the control of the national government. Officers of the volunteer force are to hold their commissions from the President, who is to command them during the war for which they shall be called out. The bill provides for an adequate system for raising, training, and officering this force of volunteers. The organization is to be maintained only during the existence of war or while war is imminent and shall be raised and organized only after Congress has authorized the President to raise such a force or to call into the actual service of the United States the militia of the several States.

EXPENDITURES. The total expenditure of the War Department for the fiscal year ending June 30, 1911, was \$153,691,030. Of this sum, \$1,983,005 was for the civil establishments; \$100,031,184 was for the military establishment, including the support of the Army Military Academy and militia, \$10,850,564 for military public works; \$6,373,328 for miscellaneous expenses. Appropriations for the fiscal year ending June 30, 1912, amounted to \$141,489,788.

MILITIA. The organized militia in 1911 numbered 117,988 officers and men, a net decrease of 1672 from 1910. In addition to the usual camps of instruction for officers, more than 1000 officers of the organized militia served for periods of fourteen days with the manœuvre division of the army at San Antonio, Tex. Twelve batteries of field artillery were given instruction with the regular army batteries at Sparta, Wisconsin, and the coast artillery reserves received the usual instruction at fortifications. The mobile militia of Massachusetts conducted manœuvres in July under conditions resembling as closely as possible those of war. By act of Congress approved March 3, 1911, the President is authorized to detach not exceeding 200 officers of the active list from their commands for duty as inspectors and instructors of the organized militia, 200 additional officers being created in the regular army to support this additional requirement. See the articles **MILITARY PROGRESS** and **AERONAUTICS**.

NAVY

Statistics relating to the strength of the United States navy in 1911 will be found in the articles **BATTLESHIPS** and **NAVAL PROGRESS**.

ADMINISTRATION. The chief problem of the Navy Department is one of effective administration, and the Secretary of the Navy during 1911 devoted much time to study and investigations leading to greater efficiency. In 1909 steps were taken to place at the disposition of the Secretary of the Navy expert knowledge and information in order that he might keep in touch with matters over which he has charge. The essential feature of the plan is the grouping of different bureaus of the department in two divisions and the appointment of four aids, who are to keep informed as to the work of each division and supply the secretary with necessary expert advice on the duties coming under these divisions. These four aids are as follows: Aid for operation, aid for inspection, aid for material, and aid for personnel. The operation of this plan has been very successful toward improving the organization and efficiency of the department. It has also brought about considerable economy in administration.

NAVY YARDS. The administration of the navy yards has been a serious problem for many years. While the administration has materially improved during the past two years experience is demonstrating the necessity for more complete and unified control at the Department of Washington over the management of the yards. During the year Secretary Meyer visited several navy yards in England and as a result of this inspection he recommends certain changes in administration and equipment. In his opinion a central office could be advantageously established in the Navy Department, which should consider methods of navy yard work and the solution of various questions connected with plant improvement and shop management. This office has already been established under the assistant secretary, who will thus combine in his office the handling of all kinds of labor, improvement of plants, new buildings, and the methods of conducting work. The establishment of this office will greatly simplify and unify the methods of conducting the business with regard to the navy yards and result in better coordination. Secretary Meyer's observation of the method of administration in English navy yards convinced him that the two-division organization now employed in American yards, Hull and Machinery divisions, each presided over by an expert in that branch, is logical and entirely correct. Another interesting result of his visit was his conviction that the efforts at scientific management in the navy yards have not resulted in improved conditions.

The abolition of certain navy yards has engaged the attention of the secretaries of the navy for several years. The chief opposition to such steps has been political. In June, 1911, the whole question of navy yards was submitted to a joint board of the army and navy. Their report had not been completed at the end of the year. The general principle for reorganization of the yards includes the retention of the Philadelphia yard, which possesses a freshwater basin which is capable of accommodating all the reserve vessels of the navy. This yard is most suitable as the home of the reserve fleet, which will comprise 12 battleships and a num-

ber of cruisers and auxiliaries. The Charleston Navy Yard will increase in importance with the prospective increase of the torpedo fleet. It is proposed to make this yard the principal torpedo base. The Key West Naval Station, from its strategical location, is important as a base for torpedo vessels and it is essential that it should be further developed and improved. The Panama Canal, which for all practical purposes will become a part of the coast line of the United States and is destined to become the most important strategical point in the Western Hemisphere, makes necessary a Caribbean naval base with adequate docking and repair facilities. In the opinion of the Secretary of the Navy the best location for this station is Guantánamo Bay, Cuba, which is now held by the United States. This base will not only give control of the Caribbean with all its lines of approach to the canal, but, with the torpedo base at Key West, will render the Gulf of Mexico immune from attack. The Panama Canal will be in effect a naval base, since the docking and repair facilities to be provided there for naval vessels will meet requirements in time of war.

DOCKS. The docking facilities for naval vessels were slightly increased during the year. The act of March 4, 1911, authorized the enlargement of Dry Dock No. 2 at Boston. Dry Dock No. 3 at Norfolk was lengthened during the year. This dock will now take the largest ship contemplated. Three large docks are under construction: No. 4 at New York, No. 2 at Puget Sound, and No. 1 at Pearl Harbor. A congressional appropriation of \$550,000 to finish Dry Dock No. 4 at New York was recommended. This was to be completed and floated for its first test December 31, 1911. The Secretary of the Navy recommends a floating dry dock, capable of lifting the largest naval ship. This dock should have a lifting capacity of 35,000 tons. It would be approximately 650 feet long by 150 feet wide and be able to take a ship of 35 feet draft. See **DOCKS** and **HARBORS**.

FLEET REORGANIZATION. The reorganization of the fleet, which provides for a systematic and periodic visit of all vessels to their home yards for all necessary navy yard repairs; for the maintenance of the ships by their own crews in a greater and increasing degree; for more uniform and continuous employment for the yard forces; and, generally, for increased economy with efficiency, was carried into effect during the year. This reorganization provides for the readiness for service at all times of at least 17 battleships and for the readiness of all others on short notice. The operations of the fleet and the movements of vessels have been so regulated as to give as far as practicable reasonable time for overhauling machinery after extended sea trips. This is necessary to keep the engines in good condition and it encourages the crews to keep their vessels in repair. A revision of the "Regulations for the Government of the Navy" has been undertaken and will shortly be completed. This revision was necessary, owing to the recent changes in organization and administration effected in the fleet.

ACTIVE AND RESERVE FLEETS. The active fleet includes the Atlantic Fleet, the Pacific Fleet, the Asiatic Fleet, the Atlantic Torpedo Fleet, and the Pacific Torpedo Fleet. The Atlantic Fleet was engaged during 1911 in such cruising and exercises as seemed most desirable to improve and maintain its efficiency. In Decem-

ber, 1910, this fleet, under the command of Rear-Admiral Seton Schroeder visited Gravesend and Weymouth, England, Cherbourg and Brest, France, and in June the second division of the fleet under the command of Rear-Admiral C. J. Badger made a cruise in the Baltic, visiting Copenhagen, Denmark; Stockholm, Sweden; Kronstadt, Russia; and Kiel, Germany. The officers and crews received a most cordial welcome at all the ports visited. Advantage was taken of the fleet's passage through the English Channel to Guantánamo in January, 1911, to work out a scouting or searching problem, the battleship fleet acting as the "enemy" and the armored cruiser and scout divisions and a division of destroyers comprising a scouting force under the command of Rear-Admiral Staunton. The fleet spent about two months in Guantánamo and about one month in Cape Cod Bay, during which period many valuable exercises in battle tactics were carried out. On June 1, 1911, Rear-Admiral Hugo Osterhaus succeeded Rear-Admiral Schroeder as commander-in-chief. Early in July the fleet representing the "enemy" engaged in exercises against the Atlantic Torpedo Fleet and several naval militia vessels in the vicinity of the eastern end of Long Island. These exercises were undertaken primarily for the instruction of the naval militia organizations and proved of considerable value and interest to all engaged.

The Pacific Fleet, under the command of Rear-Admiral Chauncey Thomas, having been in continuous active service for several years, spent a considerable portion of the year 1911 overhauling its vessels. The fleet remained on the home coast throughout the year and spent all available time in exercises most needed to increase its efficiency. A considerable period was devoted to torpedo exercises with and against the Pacific Torpedo Fleet under conditions simulating war, from which much valuable experience was gained.

The Asiatic Fleet was commanded by Rear-Admiral John Hubbard until May 16, 1911, when he was succeeded by Rear-Admiral John D. Murdock. The vessels in this fleet performed valuable and efficient service in safeguarding American interests in Asiatic stations, particularly during the revolution in China.

The Atlantic Torpedo Fleet was increased during the year to 20 destroyers and 7 submarines. The fleet was very actively employed and accomplished a large amount of instructive work to the great benefit of the torpedo service. During the Atlantic Fleet drills at Guantánamo and Cape Cod Bay the Torpedo Fleet was attached to the Atlantic Fleet.

The Pacific Torpedo Fleet was actively engaged and did much excellent work in preparation and training for war, especially in the joint exercises with the Pacific Fleet, referred to above.

The Reserve Fleet includes older battleships. There are now four of these vessels ready for active service, the *Maine*, *Iowa*, *Indiana*, and *Massachusetts*. Five more, the *Alabama*, *Illinois*, *Wisconsin*, *Kearsage*, and *Kentucky*, will be ready by March 15, 1912. These nine battleships, together with the cruisers *Brooklyn*, *Columbia*, and *Minneapolis*, and such other vessels as it may be necessary or desirable to keep out of active service for long periods, will be organized as the Atlantic Reserve Fleet under the command of a rear-admiral, and vessels of

this fleet will be maintained in active service at a few hours' notice so far as their material condition is concerned, but each will have only the nucleus of a crew, the authorized enlisted strength of the navy being insufficient to assign them full crews. This plan will insure the readiness for war of practically every vessel of fighting value.

PERSONNEL. The Secretary of the Navy in his annual report points out several serious defects in the organization of the personnel of the navy, chiefly as related to line officers. The first of these faults is the method of promotion to flag rank. It does not insure providing flag officers with a length of service on the active list sufficient to permit them to acquire the experience necessary in handling a modern battleship fleet. While American officers have from one to five years' active service in command, the average British flag officer has twelve or fourteen years in flag rank, and the oldest has in the neighborhood of twenty. Second, no provision is made for any except the lowest grade in flag rank, that of rear-admiral. The recognized grades of rank are admiral of the fleet, admiral, vice-admiral, and rear-admiral. A battle fleet should be commanded by an admiral with a vice-admiral in command of each of the squadrons, and a rear-admiral in command of each of the divisions. Third, no provision is made for increasing the various grades in proportion as the total of all grades increases. While the present law is gradually bringing up the total to that required for the existing and prospective fleet, the grades remain as they were when the total was scarcely more than half the present total. Fourth, midshipmen are not commissioned until two years after graduation, during which time they are officers in a qualified sense and serve at sea, but are denied the right of pension and retirement in case of injury, a right conceded to all other officers and men. These faults and others of only less importance are corrected in the bill introduced in the Sixty-first Congress.

The personnel of the enlisted men of the navy steadily improves in character, knowledge, and efficiency. An increased number of men seek the service for the advantage which it offers for a permanent occupation. With the passage of a graded retirement law it is believed that the number of good men seeking enlistment will be larger and that the percentage of desirable reenlistments will be materially increased. The enlisted force of the navy is insufficient to man the ships effectively. There is a deficiency of approximately 4000 men.

MOBILIZATION OF FLEETS. Two important mobilizations took place during 1911. On October 30 the vessels on the Atlantic coast were mobilized at New York City and those on the Pacific coast at San Diego, Cal., in preparation for a review two days later. These mobilizations were for the purpose of testing the preparedness of the fleet and the efficiency of the organization of the ships in the navy yards. At New York the mobilization included 24 battleships, 2 armored cruisers, 2 cruisers, 22 destroyers, 16 torpedo boats, 8 submarines, 8 tenders to torpedo fleet, 4 gunboats, 9 miscellaneous ships, 8 colliers, 1 oil tanker, and 3 tugs, or a total of 98 vessels of all classes, with a tonnage displacement of 576,634. On November 1 the ships assembled at New York were inspected by the Secretary of the Navy and on the follow-

ing day President Taft reviewed the fleet both at anchor and as it steamed out of the harbor in fleet formation. The review was a complete success and was an object lesson to the people in that there was assembled the largest and most powerful collection of vessels ever possible under the United States flag.

The force assembled at San Diego on October 20 consisted of 1 battleship, 5 armored cruisers, 2 cruisers, 8 destroyers, 2 torpedo boats, 2 submarines, 1 gunboat, 1 tender to submarines, and 4 miscellaneous ships, with a total tonnage displacement of 117,957. While this review was much smaller than that on the Atlantic coast, it was eminently successful and was particularly interesting because it contained the battleship *Oregon*, recently constructed.

NAVAL MILITIA. In 1911 23 States and the District of Columbia supported naval militia organizations aggregating a force of approximately 6800 men and 600 officers. Organizations during the year were formed in the States of Washington, Oregon, and Florida, and in the States of Pennsylvania and Michigan two new divisions were mustered in. During the year certain naval military organizations were sent on their annual summer training cruises on board the battleships of the Atlantic Fleet, thus affording them an opportunity of training with the latest and best naval material and bringing them into close touch with the regular navy. To the naval militia service are assigned 34 vessels. See **AERONAUTICS**.

APPROPRIATIONS. The final estimates for the expenses of the navy for the fiscal year 1912 amounted to \$129,248,709. There was appropriated by Congress \$129,178,169. The estimates for 1913 amounted to \$129,107,012.

POST OFFICE

For the first time since 1883 the report of the Post Office Department in 1911 showed a surplus instead of a deficit. The revenues for the fiscal year ending June 30, 1911, amounted to \$237,879,823 and the expenditures to \$237,660,705, leaving a surplus of \$219,118. At the beginning of the present administration in 1909 the postal service was in arrears to the extent of \$17,479,770, which was the largest deficit on record. In two years this was changed to a substantial surplus. This gain was not made by curtailing postal facilities. On the contrary, important extensions were made during the year in every branch of the service. The amount expended for salaries was approximately \$4,000,000 greater than in 1909. The average annual salaries for rural carriers was increased from \$869 to \$967; for post office clerks, \$979 to \$1082; for city letter carrier, from \$1021 to \$1084; and for railway postal clerks, from \$1168 to \$1183.

The most important event of the year was perhaps the successful organization of the postal savings system. (See **POSTAL SAVINGS BANKS**.) The Postmaster-General in his annual report continues to advocate the establishment of a parcels post (q. v.). He also urges the readjustment of postage rates, especially in regard to second-class mail, in the handling and transportation of which there is at the present time a loss. For an account of the controversy in connection with this recommendation, see below *Congress*.

In accordance with a plan perfected in 1910

assistant postmasters have been recommended to the Civil Service Commission for classification as rapidly as it is possible to ascertain by careful investigation their qualifications for efficient service. The effect of classification has been to stimulate these officers in the performance of their duties. The Postmaster-General points out that the same consideration which led to the classification of the position of assistant postmasters in presidential post offices applies with equal force to the postmastership itself. He says that a full measure of efficiency in the postal service cannot be expected so long as the postmasters are subject to political control.

The crusade against the fraudulent use of the mails begun in 1910 was continued during the year. There were altogether 529 indictments and in these cases 184 convictions were secured, with but 12 acquittals. The swindlers thus convicted had fraudulently obtained from the public many millions of dollars.

The total revenue from the operation of the Post Office Department in 1911 was \$237,879,823. Of this amount \$213,666,448 came from the sale of stamps, stamped envelopes, newspaper wrappers, and postal cards; \$8,933,098 from second-class postage; \$5,049,918 from third- and fourth-class postage, and \$4,406,843 from receipts from box rent in post offices.

PENSIONS

The total number of pensioners on the rolls on June 30, 1911, was 892,098. Of these 529,884 were survivors of the Civil War. There were 279 pensioners (widows) of the War of 1812; 1387 survivors and 2629 widows of Indian wars; 1639 survivors and 5982 widows of the War with Mexico; 23,383 survivors and 1217 widows of the War with Spain. In the regular army were 13,757 invalids and 2799 widows. The total number of pensioners on the rolls at the close of the fiscal year 1910 was 921,083. The losses of the roll from June 30, 1910, to June 30, 1911, were 55,185 and the gains were 26,200, or a net loss of 28,985. The survivors of the Civil War whose names were dropped from the roll during the year on account of death numbered 35,243.

The total amount paid as pensions during the fiscal year 1911 was \$157,325,160, as compared with \$169,974,056 in the fiscal year 1910. The total amount paid by the United States for pensions since the foundation of the government to June 30, 1911, was \$4,230,381,730. Of this amount there has been paid to survivors of the Civil War and their descendants \$3,985,719,836. The greater number of soldiers of the Civil War who received pensions received them under the act of February 6, 1907, which provides for an increase of pension after the ages of seventy and seventy-five years. From the date of its approval to June 30, 1911, there were 629,605 applications for pension or increase of pension under this act. During the fiscal year 1911 55,167 certificates were issued under this law.

The Commissioner of Pensions in his annual report gives a summary of the surviving officers of the Civil War. It appears from this summary that the number was as follows on June 30, 1911: Major-generals, 2; brigadier-generals, 13; colonels, 173; lieutenant-colonels, 423; majors, 758; captains, 5844; first lieutenants, 7697; second lieutenants, 5834, or a total of

20,844 surviving officers of the Civil War on the pension rolls.

The last pensioner of the Revolutionary War died April 25, 1911, aged ninety years. This was Mrs. Phebe M. Palmeter, who was pensioned by a special act of Congress as the daughter of Jonathan Wooley. The last widow pensioner of that war was Esther S. Damon of Plymouth Union, Vt., who died November 11, 1906, aged ninety-two years.

During the year 124,319 pension claims were adjudicated, of which 92,274 were admitted, 30,980 were rejected, and 1065 approved in which no certificates were issued because they would not have benefited the applicants.

The amount expended for pensions for the navy in the fiscal year 1911 was \$5,392,485, as compared with \$5,335,457 in 1910. The law provides that navy pensions shall be paid from the income of the navy pension fund, so far as the same shall be sufficient for that purpose. The income of the fund during the fiscal year 1911 amounted to only \$387,159, a small fraction of the sum required for payment of these pensions.

At the close of the year there were pending 36,793 claims. Of these 25,153 were Civil War claims; 8386 claims for the War with Spain; 189 Mexican War claims; 173 Indian War claims; 1 claim War of 1812; 17 old wars, and 2874 claims of the regular army.

NATURALIZATION

The number of certificates of naturalization issued during the fiscal year 1911 was 55,329. The number of applications denied was 9017, making the total number of applications made 64,346, compared with 46,987 in 1910. The number of declarations of intention filed during the year was 186,157. The number of petitions for naturalization filed was 73,644. There was an increase of about 11 per cent. in the declarations and 33.8 per cent. in the petitions filed during the year as compared with those filed in 1910. By far the largest number of certificates were issued in New York. These numbered 11,158. Other States in which a large number of certificates were issued were: Pennsylvania, 6828; Illinois, 5162; New Jersey, 3040; Wisconsin, 2626; Massachusetts, 2879; Minnesota, 2579; California, 2742, and Michigan, 2140.

PATENTS

During the fiscal year 1911 65,154 applications for mechanical patents were received and 1315 for designs. The number of patents granted was 34,428. These included reissues and designs. The number of patents that expired was 22,546. The Commissioner of Patents in his annual report urged that provision be made for more room for housing the Patent Office. The present structure is not fireproof and is filled with tons of inflammable material, comprising the secret archives of the office, which if destroyed would work untold damage to the commercial interests of the country.

BUREAU OF MINES

The Bureau of Mines was established by act of Congress approved May 16, 1910. Its main object is to aid in lessening the losses of life and waste of resources in the mining, quarrying, metallurgical, and other mineral industries of

the country. To it was transferred by act of Congress the work hitherto done by the Geological Survey in analyzing and testing coals, lignites, and other minerals for substitutes, and investigating the causes and means of preventing mine explosions.

The investigating work of the bureau during 1911 related mainly to the study of fuels belonging to or used by the government and inquiry into the causes and means of prevention of mine accidents. The first of these had primarily to do with the purchase for the use of the government of coal, aggregating in cost about \$8,000,000; the most efficient methods of using this coal at the various heating, power, and lighting plants of the government and on board the government ships; and the safest and most efficient methods of storing coal at navy stations, army posts, etc. More than 10,000 samples of coal were analyzed in the laboratories of the bureau. The fuel investigations also included the testing and analyzing of a large number of samples of fuel oil, and the preparation of specifications for use by the government in the purchase of both oil and coal for fuel purposes.

The investigation into the causes and means of preventing mine accidents extended during the year as rapidly as circumstances would permit. The chief aim of the investigation has been to determine the cause of mine explosions; to make safer the use of explosives and electricity in mines; and to reduce the risks through falls of roof, the use of open lights, and other mining conditions. It was found early in the examination of mine disasters that it was necessary to provide facilities for the engineers of the bureau in entering mines where the disasters had occurred while these mines were still full of poisonous gases. These are useful in rescuing entombed miners. To meet this need there were established by the bureau six mine-rescue or mine-safety stations, one each at Pittsburgh, Pa., Knoxville, Tenn., Birmingham, Ala., McAlester, Okla., Urbana, Ill., and Seattle, Wash. There were also purchased seven mine-safety cars, which were equipped as far as practicable with mine-rescue and fire-fighting apparatus. In spite of the newness of the work and the preliminary difficulties, the progress made in behalf of greater safety in mining has been gratifying. The bureau is winning hearty cooperation of mine workers, mine owners, State mine inspectors, and manufacturers of mine explosives and mine equipment. In coal mines black powder is rapidly giving way to safer explosives, and safety lamps and other appliances are being increasingly used; improvements in electrical installations are under investigation; mine explosions are being better understood and are becoming less frequent; mine-safety demonstrations in connection with the work of the stations and cars have been witnessed and participated in by more than 100,000 miners; over 14,000 miners have received some training in rescue and first-aid efforts, and more than 500 sets of mine-rescue equipment have been installed in the large coal mines in different parts of the country.

CUSTOMS

The prosecutions for customs frauds continued during 1911. In June frauds were disclosed in the importation of laces from Syria on false invoices. Several merchants in New

York were indicted on charges of systematic undervaluation of goods and were sentenced to pay large fines. Three members of the art importing firm of Duveen Brothers, who were arrested in 1910 on the charge of defrauding the government by undervaluation to the amount of \$5,000,000, on March 22 pleaded guilty to the charge. Each paid the maximum fine of \$10,000 and made a settlement with the government, depositing \$1,200,000 in the United States treasury in discharge of all claims against the firm for duties alleged to have been underpaid.

DIPLOMATIC SERVICE

The year 1911 was notable for the unusually large number of changes made in the diplomatic service both in representatives to the United States and those representing the United States in foreign countries. On January 7 the resignation of Oscar S. Straus as ambassador to Turkey was accepted by President Taft, and W. W. Rockhill, previously ambassador to Russia, was appointed to succeed him. To take Mr. Rockhill's place at St. Petersburg the President appointed Curtis Guild of Massachusetts. The resignation on April 14, 1911, of David J. Hill as ambassador to Germany made it necessary for the President to appoint his successor, and John G. A. Leishman, previously ambassador to Italy, was appointed to fill this vacancy. To fill the place thus left vacant, Thomas J. O'Brien was transferred to Italy, and Charles Page Bryan, previously minister to Belgium, was appointed to succeed Mr. O'Brien as ambassador to Japan. In November Irving B. Dudley (q. v.), ambassador to Brazil, died, leaving one ambassadorship vacant at the close of the year. Of the ambassadors appointed previous to 1910 Richard C. Kerens, Austria-Hungary, Robert Bacon, France, Whitelaw Reid, Great Britain, and Henry L. Wilson, Mexico, retained their posts in 1911. At the close of the year Mr. Bacon announced that he would resign in 1912, as a

result of having been elected one of the overseers of Harvard University. The ambassadors to the United States from foreign countries remained the same in 1911 as in the previous year, except that Don Francisco de la Barra, ambassador from Mexico, was succeeded by Don Gilberto Crespo y Martínez, and Baron Rosen, ambassador from Russia, was succeeded by George Bakhmeteff. Among the ministers representing the United States in foreign countries there were many changes. In most cases, however, these were transfers in the nature of promotions from one country to another. With Nicaragua diplomatic relations, which had been interrupted for several years, were resumed, and a minister was appointed to represent the United States in that country. This was Elliott Northcott of West Virginia, who subsequently was transferred to Venezuela, being succeeded in Nicaragua by George T. Weitzel of Missouri. There were many new ministers from foreign countries to the United States. There were new representatives from Argentina, Belgium, Colombia, Cuba, Haiti, Honduras, Nicaragua, Panama, and Uruguay.

A bill providing for the purchase or erection of adequate buildings for American embassies, which has been before Congress in one form or another for many years, was finally passed at the last session of the Sixty-first Congress. By this bill provision was made that not more than \$500,000 shall be expended in any fiscal year for the purchase or erection of such embassies. The cost for the acquisition of sites and buildings and for the construction, alteration, repairing, and furnishing of buildings at each place is not to exceed the sum of \$150,000. The bill was passed largely as a result of the efforts of the American Embassy Association, which for years has labored to bring about this result.

The tables below give the American and foreign diplomatic representatives in 1911:

CABINET

There were two notable changes in President Taft's cabinet during the year. On March 7 Richard L. Ballinger, Secretary of the Interior, resigned, and was succeeded by Walter L. Fisher (see *Administration*). Jacob M. Dickinson, Secretary of War, was obliged to resign that office for personal reasons, and Henry L. Stimson of New York (q. v.) was appointed to succeed him. The cabinet consisted of the following members: Secretary of State, Philander Chase Knox; Secretary of War, Henry Lewis Stimson; Attorney-General, George Woodward Wickersham; Postmaster-General, Frank Harris Hitchcock; Secretary of the Navy, George von Lengerke Meyer; Secretary of the Interior, Walter Lowrie Fisher; Secretary of Agriculture, James Wilson, and Secretary of Commerce and Labor, Charles Nagel.

FEDERAL JUDICIARY

The death of Associate Justice Harlan caused the only vacancy which occurred in the United States Supreme Court in 1911. A successor to Justice Harlan had not been appointed at the end of the year. The Supreme Court consisted in 1911 of the following members: Chief Justice, Edward D. White of Louisiana; Associate Justices, Joseph McKenna of California, Oliver W. Holmes of Massachusetts, William R. Day of Ohio, Horace H. Lurton of Tennessee, Charles E. Hughes of New York, Willis Van Devanter of Wyoming, and Joseph Rucker Lamar of Georgia. The Supreme Court made some notable decisions during the year. Those which attracted the most attention were those calling for the dissolution of the American Tobacco Company and the Standard Oil Company. For an account of these decisions see these articles. See *TRUSTS* and *RAILWAYS* for other decisions.

An important step in remedying the evils of delay in legal procedure was taken in June, when a committee of three of the justices of the Supreme Court of the United States were appointed to undertake a revision of the rules of practice in federal courts of equity. The chairman of the committee was Chief Justice White. The other members were Justice Lurton and Justice Van Devanter. While the remedies suggested by this committee will apply to a limited field in legal jurisdiction, it is a field where reform is very especially needed and where much can be accomplished by comparatively small changes. In addition, the example set by the action of the Supreme Court is likely to be followed by State courts and it may prove

a starting point for radical revision of the American judicial procedure.

As the result of the Congressional act passed in 1910 the circuit courts of the United States were abolished, and their functions were assumed by the United States district courts.

TREATIES

The most important treaties during the year were those providing for complete arbitration between the United States, Great Britain, and France, described in the article *ARBITRATION*.

In March the Senate ratified by unanimous vote the new treaty negotiated between the United States and Japan by President Taft, Secretary Knox, and the Japanese government. It was necessary to negotiate a new treaty on account of the fact that a clause of the present treaty, though satisfactory when originally drawn, had come to be a source of irritation to the Japanese people and government. This clause was as follows: "It is, however, understood that the stipulations contained in this and the preceding article do not in any way affect the laws, ordinances, and regulations with regard to trade, the immigration of laborers, police, and public security which are in force or which may hereafter be enacted in either of the two countries." The phrases to which the Japanese government objected were "the immigration of laborers" and "which may hereafter be enacted." These phrases expressly affirm the right of the United States to exclude Japanese laborers from that country. The Japanese government complained that no such provision was made in treaties with European powers, and they objected to being differentiated in this way from other civilized nations of the world. The new treaty omits the provision relating to immigration. In the opinion of President Taft the agreement which exists between the two governments in the form of exchange of notes sufficiently protects the United States in the exercise of its right to regulate Japanese immigration. He therefore urged the ratification of the treaty.

In January a convention was signed by Secretary Knox and Gen. Juan E. Paredes, representative of Honduras, which had for its intention the financial rehabilitation of that country, with the United States as sponsor and guarantor. This action was in harmony with the recommendations made in the message of President Taft of December, 1910, when he declared that a strong Honduras would tend immensely to the progress and prosperity of Cen-

TWO NEW MEMBERS OF PRESIDENT TAFT'S CABINET IN 1911

tral America. The agreement provides in effect a loan of \$10,000,000 to Honduras to be made by J. P. Morgan & Company, with the loan to be secured by the Honduran customs revenue. In case of any friction occurring between the financial syndicate and the government of Honduras, provision is made for the adjustment of difficulties by the submission of the question to the heads of the two governments involved. The debt of Honduras is estimated at about \$112,000,000, the accumulation of principal and interest on four loans made at various times since 1867. In 1909 J. P. Morgan & Company entered into arrangements with the holders of Honduran bonds in Europe by which, if the settlement of the loan then proposed was effected through the auspices of the United States, 15 per cent. of the value of the bonds would be paid. The loans procured by Honduras since 1867 were to have been applied to the construction of an inter-oceanic railway joining the Atlantic and Pacific seacoasts of the country at Puerto Cortés and the Bay of Fonseca. The frequent changes of administration and the alleged misappropriation of funds obstructed the progress of this railway. Of the loan obtained, as noted above, by J. P. Morgan & Company, it is intended to utilize about \$8,000,000 toward the completion of this railway.

A similar treaty was negotiated with Nicaragua in June but the Senate had not ratified these treaties at the close of the year.

The fur seal controversy, which for nearly twenty-five years has been the source of serious friction between the United States and the powers bordering on the North Pacific Ocean, whose subjects have been permitted to engage in pelagic sealing against the fur seal herds, which have their breeding grounds within the jurisdiction of the United States, was satisfactorily adjusted by the conclusion of a convention entered into between the United States, Great Britain, Japan, and Russia on July 7, 1911. This convention is, in effect, an international game law for the protection of seals.

CONGRESS

SIXTY-FIRST CONGRESS. The Sixty-first Congress met in its third and last session on December 5, 1910. No action was taken on important legislative measures before the adjournment for the holiday recess. The President's message containing a résumé of the foreign relations of the United States and containing recommendations for economy in administering the affairs of the government was received and read on December 6. On January 5 both branches of Congress reassembled after recess.

HOUSE RULES. The first important action of the House was in relation to the rules. On January 5 the majority of the House took action directly in contradiction to that taken on the memorable struggle to change the rules, which ended on March 19, 1910. At that time the insurgent Republicans, supported by the Democrats, accomplished three results: First, they substituted for an arbitrary rules committee, selected by the Speaker, one selected directly by the House; second, they established a precedent that a motion to vacate the chair, that is, to depose the Speaker, is a motion of the highest privilege and therefore always in order; and third, they secured from the House, against the will of Speaker Cannon, a ruling that a motion to change the rules of the House is in

order at any time. On January 5 Representative Fuller of Illinois, a Republican, offered a resolution to change a rule of the House. Representative Mann of Illinois, one of the most conspicuous opponents of the action taken in March, 1910, made a point of order that this resolution was not privileged. The Speaker thereupon made a ruling in which he declined to follow the precedent set by the House in March, 1910. He declared that if the chair followed the construction placed by the majority of the House at the last session, the chair would overrule the point of order. He said: "However, the House is now in good temper. There is no election pending in the near future. The great press of the country and the great leaders of the respective parties are quiet. We are not excited. . . . The chair declines to follow the judgment of the House at the last session of this Congress at which it made the precedent. The chair therefore in effect appeals to the House from the decision of that same House made in high excitement when the waves of partisanship were high." In a vote to sustain or reject the ruling of the Speaker the regular Republicans consistently supported him. The insurgent Republicans and a group of insurgent Democrats voted to sustain the precedent, but the regular Democrats, who follow party leaders and were particularly insistent in overruling the decision of the Speaker in March, 1910, repudiated their former action. It is therefore due to them that the precedent established at that time is overturned.

THE LORIMER CASE. On January 9 Senator Beveridge presented in the Senate the minority report of the committee on privileges and elections, declaring that Senator Lorimer was not legally elected to the Senate of the United States. Discussion of this case was carried on in the Senate during January and February.

On February 3 Senator Root made what was probably the most vigorous and convincing speech in support of the resolution declaring the seat of Senator Lorimer vacant. He went carefully over the evidence and insisted on the weakness, even from a technical point of view, of Mr. Lorimer's defense. He pointed out that the Senate in forming its judgment was bound, not by technicalities of the law courts, but by the laws of moral intelligence. The speech was listened to with profound interest by his colleagues in the Senate and by listeners in the galleries.

A vote was taken on the Lorimer resolution on March 4. It was defeated by 46 to 40. Thirty-six Republicans and 10 Democrats supported Mr. Lorimer, while 22 Republicans and 18 Democrats voted for his exclusion. The division, especially among the Republicans, was along the lines separating the "stand-pat" senators from the progressives or insurgents. Voting against the resolution were found such conservative senators as Senators Burrows, Carter, Depew, Guggenheim, Hale, Heyburn, and Penrose, while among those who voted for the resolution were progressive Senators Beveridge, Bourne, Bristow, Clapp, La Follette, Cummins, and Nelson. Among those who voted in favor of Senator Lorimer were ten senators whose terms expired with the Sixty-first Congress. The close vote was, in general, a surprise, as it had been thought that the supporters of Senator Lorimer would be able to

muster greater strength than was shown in the final vote.

TARIFF BOARD. The House passed on January 30 a bill to establish a permanent, non-partisan tariff board. The measure as finally adopted was a compound of two bills, one introduced by Representative Longworth of Ohio and the other by Representative Dalzell of Pennsylvania. It provided that the tariff board should be composed of five members, appointed by the President and removable by him. The tenure of office was so arranged as to make the board a continuing body, unaffected as a whole by political changes. Its function was to make investigations concerning matters affecting the tariff. These investigations were to be with special reference to the cost of production, but they were not to be confined to that. The bill provided in addition that the information that the board is entitled to secure includes all other facts which may be necessary or convenient in lessening import duties or in aiding the President and other officers of the government in the administration of the customs laws. The measure further required that the board should also make investigations of any such subjects whenever directed by either house of Congress. It was provided that the board, under the direction of the President, should report upon the effect of tariff laws or bounty laws as enacted in foreign countries. It took measures to safeguard information thus obtained from any individual or company so that it should not be available for use by any competitor or rival. The board was given power to subpoena witnesses, administer oaths, and to require the production of pertinent documents. The board thus created was designed to supersede the tariff board created by the terms of the Payne-Aldrich tariff act. This bill passed the Senate, but amendments having been made, it was obliged to go to conference and Congress adjourned before action could be taken and the bill agreed upon.

DIRECT ELECTION OF SENATORS. On January 11 Senator Borah presented the report of the committee on Judiciary favoring the constitutional amendment providing for the election of senators by direct vote of the people. This resolution was defeated on February 28 by a margin of four votes. On the roll call 54 senators voted in favor of the resolution and 33 against it. Such a resolution, however, requires a two-thirds vote, and the measure failed for lack of four votes. The resolution was practically defeated by the votes of Southern senators who, while they favored the proposal for direct election of senators, declined to vote for the amendment incorporated in it which provided that the control of senatorial elections should remain in the hands of the federal government. The resolution in its original form provided that the control of elections should be taken from the federal government, where it now reposed by Section 4 of Article 1 of the Constitution, and placed in the hands of the State legislatures. The Southern senators who voted against it expressed the fear of negro domination if there should be federal control of the elections.

CANADIAN RECIPROCITY BILL. Representative McCall of Massachusetts on January 28 introduced the Canadian Reciprocity bill in the House. It was debated until February 14, when it was passed by a vote of 221 to 92. See **TARIFF.**

Although its passage was expected it had several notable aspects. It was the only example under the new rules of the House of the passage of a measure to which the Speaker was actively opposed. Its passage also indicated a change in public sentiment toward trade relations with foreign countries. The bill was passed by a vote of about 2 to 1. Its passage was insured by the votes of Democrats, of whom nearly every member in the House voted for the bill. A majority of the Republicans voted against the measure and those voting against were in proportion of two regulars to one insurgent. The insurgents from Wisconsin and Minnesota were divided in the voting and those from Iowa, Nebraska, and Kansas voted against the bill. In general, the representatives of the great agricultural States of the Middle West were found in opposition to the bill. It did not reach a vote in the Senate.

SECOND-CLASS POSTAGE. An attempt of the Postmaster-General to have passed a law increasing the postage on second-class mail matter attracted wide attention chiefly from the strenuous opposition made by publishers to the proposed increase. The provision to increase the rate was made not in a separate bill but in a "rider" attached to the Post Office Appropriations bill. The "rider" was attached when the Appropriations bill was in the Senate committee on post offices and post roads and the action was taken without notice to the publishers. The "rider" provided that the rate of postage on the reading pages of the periodicals should continue to be one cent a pound, while in the case of any periodicals except newspapers the rate on "sheets containing in whole or part any advertisement with a display descriptive or textual" should be four cents a pound. Further exception was made in publications mailing less than 4000 pounds of each issue. These were not liable to the increased rate.

When the Post Office Appropriations bill was reported to the Senate through the committee on post offices and post roads, Senator Penrose, chairman of the committee, announced that the "rider" increasing the rate of postage on the advertising pages of magazines and periodicals would, with the consent of the Senate, be abandoned.

In place of the proposed legislation relating to rate of postage on second-class mail matter a joint resolution was passed by the Senate and the House providing for a commission to investigate the cost of transportation and handling of second-class mail. The President was authorized to appoint this commission, which is to consist of three persons, one of whom is to be a judge of the Supreme Court of the United States and the other two are to be men who hold no office. The sum of \$25,000 was appropriated to pay the expenses of this commission.

OTHER MEASURES. Among the important measures passed in this session of Congress in addition to those mentioned above, are the following:

The establishment of the policy of building and purchasing embassies and legations in foreign capitals, and appropriating not more than \$500,000 a year for this purpose; a system of federal inspection of locomotive boilers and the compulsory adoption of safety devices; the lessening of the cost of litigation by simplifying proceedings on writ of

FOUR LEADING MEMBERS OF THE HOUSE OF REPRESENTATIVES IN 1911

error or of certiorari; the facilitation of the registration of trade marks; the creation of an Appalachian and White Mountain forest reserve; provision for the fortification of the Panama Canal by the appropriation of \$3,000,000 for the purpose; authorization by House resolution to appoint a commission to investigate the white phosphorous match evil under the authority of the President; the authorization of the President to invite the nations of the world to take part in the Panama-Pacific International Exposition in 1915; the passage of a measure making compulsory respect for the dignity of the military uniform in places of public amusement; provision for two new battleships of about 29,000 tons each; the appointment of a congressional committee to investigate conditions in Alaska, and ratification of the treaty of commerce and navigation with Japan. Among the important measures which failed to pass were the following: The Canadian reciprocity agreement; the permanent tariff board bill, which was passed by the Senate, but was defeated by a filibuster in the House; the postal savings bank bill; the bill for congressional reapportionment which provided for a House of 433 members; this was passed by the House, but failed in the Senate; a resolution for the admission of Arizona and New Mexico to statehood; the constitutional amendment providing for the election of senators by popular vote; the Sulloway pension bill, which sought to increase the pension budget by nearly \$50,000,000 a year.

On March 4 at the conclusion of the session of the Sixty-first Congress, President Taft issued a brief proclamation calling upon the new Congress to assemble at noon on April 4. His proclamation stated the fact that the agreement with Canada regarding reciprocal tariff legislation had made it the duty of the President to use his best efforts to make the arrangement operative, and since the House had passed the desired bill and the Senate had not reached a vote on it, it seemed to him that an extraordinary occasion had arisen which justified the calling of a special session.

SIXTY-SECOND CONGRESS. The convening of the special session of the Sixty-second Congress on April 4 was marked by several features of unusual interest. It was the first time that a Democratic House of Representatives had assembled for sixteen years and it was the first time in the history of the government that a Democratic House had been called in extra session by a Republican President to act on an administrative measure which a Republican Senate in the previous session of Congress had refused to consider. It had been foreshadowed for many months that Champ Clark of Missouri would be elected Speaker. He declared in his speech, on assuming the Speaker's chair, that "We are this day put upon trial and the duty devolves upon us to demonstrate, not so much by fine phrases as by good work, that we are worthy of the confidence imposed in us by the voters of the land and that we are worthy of their wider confidence." He outlined the promises that the party should fulfill. These included an intelligent tariff revision downward, action looking to a constitutional amendment for the election of United States senators by popular vote, wise changes in the rules of the House, economy in public expenses, the publication of political campaign contributions before elections, and the admission of Arizona and New Mexico

as States. Through inadvertence Mr. Clark failed to mention among these questions for consideration the one for which the session had been specially convened, that of Canadian reciprocity. The first work of the Democratic majority was to establish the rules under which the deliberations would be conducted. Most of these did not differ materially from the rules of the Sixty-first Congress except that they provided for the election of committees instead of their appointment by the Speaker. "Calendar Wednesday" was continued, and the rule for the discharge of committees was broadened in scope.

ORGANIZATION OF THE HOUSE. The Democratic representatives on April 1 met in caucus and prepared for the opening of the Sixty-second Congress on April 4. The committee assignments, which had been prepared beforehand by the ways and means committee, were accepted without friction. Rules were adopted for the Sixty-second Congress differing in some important respects from those of the Sixty-first. A programme of legislation was presented and adopted. Eight subjects were contained in this programme: First, the election of United States senators by the people; second, publicity of campaign funds before and after election; third, various matters of tariff and revenue legislation; fourth, reapportionment of seats in the House under the Thirteenth Census; fifth, resolutions having to do with the investigation of the executive departments; sixth, the admission of Arizona and New Mexico as States; seventh, any deficiency appropriations that conditions might require; eighth, resolutions relating to the District of Columbia. The changes in the rules were intended to facilitate a radical cutting down of expenditures and a successful handling of particular parts of the tariff without obstructive amendments, which did not belong to the particular matter in hand. The chairmen of the principal committees appointed were as follows: Ways and means, Oscar W. Underwood of Alabama; appropriations, John J. Fitzgerald of New York; judiciary, Henry D. Clayton of Alabama; interstate commerce, William C. Adamson of Georgia; rivers and harbors, Stephen M. Sparkman of Florida; agriculture, John Lamb of Virginia; foreign affairs, William Sulzer of New York; military affairs, James Hay of Virginia; naval affairs, Lemuel P. Padgett of Tennessee; post office and post roads, John A. Moon of Tennessee; public lands, Joseph T. Robinson of Arkansas; Indian affairs, John H. Stephens of Texas; Territories, Henry D. Flood of Virginia; insular affairs, William A. Jones of Virginia; banking and currency, Arsene P. Pujo of Louisiana; coinage, weights, and measures, Thomas W. Hardwick of Georgia; merchant marine and fisheries, Joshua M. Alexander of Missouri; public buildings and grounds, Morris Sheppard of Texas; pensions, William Richardson of Alabama; District of Columbia, Ben Johnson of Kentucky; irrigation, William R. Smith of Texas; immigration, John L. Burnett of Alabama. The chairmanship of the important committee on rules was given to Robert L. Henry of Texas.

The Republicans of the House chose James R. Mann of Illinois as leader. He declined to serve on any committee and gave his whole energy to the minority leadership. He was authorized by the Republican caucus, held prior to the session, to assign Republican members to the

minority places left for them on the various committees by the Democratic caucus. The most important of these appointments were Mr. Payne of New York as the leading Republican member of the ways and means committee, and former Speaker Cannon as the chief Republican on the appropriations committee. In preparing his assignments Mr. Mann gave full recognition to the Republican insurgents of the House. The Democratic leaders showed remarkable ability in organizing and within a week the business of the House was well under way.

ORGANIZATION OF THE SENATE. As a result of the elections of 1910 the Republican majority in the Senate was reduced at the opening of the Sixty-second Congress to a majority of only nine. As a result of the election Democratic legislatures succeeded Republican in the States of Indiana, Missouri, Minnesota, Nebraska, New Jersey, Maine, New York, Ohio, and West Virginia. A change greater than the numerical was produced as a result of these elections in the character of the Senate. Not only had the so-called "standpat" Republicans lost their leaders by the retirement of Senators Aldrich and Hale, but a number of the supporters of these leaders had also died or lost their seats. This gave large powers to the well-organized group of Republicans known as Progressives. By union with the Democrats they were in a position to control the Senate and their power was shown several times throughout the session. In the reorganization of the committees, the Progressives, whose demands for committee representation had hitherto been coldly received, were able to force the committee on committees to give them valued and important places. This committee had as its members Senators La Follette, Bourne, Cummins, and Briestow, all senators in the Progressive wing of the party. The so-called steering committee, which has charge of the progress of legislation, included Senators Borah of Idaho and Brown of Nebraska, both Progressive. Senators Cummins and La Follette were appointed members of the finance committee. Senator Clapp of Minnesota was made chairman of the interstate commerce committee and Senator Bourne of Oregon was made a member of the post office committee. The chairman of the finance committee, the most powerful committee of the Senate, became Senator Penrose of Pennsylvania, who succeeded Senator Aldrich on the latter's retirement.

That the Democratic senators were not wholly in harmony was shown in the election of a leader to the opposition. Lines developed not unlike those between the insurgents and regulars in the Republican party. The candidate of the regular element, composed in the main of the older senators, was Senator Martin of Virginia, while the other element, comprising most of the newly elected senators, desired that Senator Shively of Indiana should be the Democratic leader. Senator Martin was finally chosen. Differences among the Republican senators prevented the election of the Speaker pro tempore, who presides over the deliberations of the Senate in the absence of the Vice-President. Senator Frye of Maine, who had served many years in this office, had resigned on account of ill health, and it was necessary to choose his successor. Senator Gallinger of New Hampshire, one of the oldest members in point of service in the Senate, was a candidate for the place, but it was impossible to secure enough votes for his elec-

tion, and there was no president pro tempore during the entire session.

RECIPROCITY AND TARIFF MEASURES. The composition and passage of these measures is described in the article **TARIFF**. In order to preserve the record, there will be noted here merely a chronological summary of their course through Congress. The President's message urging the approval of the Canadian Reciprocity agreement was read in both branches of Congress on April 5, and on April 12 the bill was introduced by Representative Underwood, chairman of the ways and means committee. At the same time he introduced a bill placing on the free list more than 100 articles used by farmers. The Reciprocity bill was favorably reported by the ways and means committee on April 13. The general debate on the measure closed on April 20, and on the following day it was passed in the House by a vote of 266 to 89. On May 8 the House passed the **Farmers' Free List** bill without amendment by a vote of 236 to 109. The ways and means committee on June 6 reported a bill revising the wool schedule of the Payne-Aldrich tariff and on June 20, by a vote of 221 to 100, this bill was passed. In the Senate the Reciprocity measure was passed on July 22 by a vote of 53 to 27, and on July 27 by a coalition of Progressive Republicans and Democrats a compromise wool bill, intended to be a substitute for the House measure, was passed. This bill was submitted by Senator La Follette. On August 1 the **Farmers' Free List** bill was passed in the Senate by a coalition of Democrats and Progressives. As the Wool bill had received amendments in the Senate it was necessary to go into conference and on April 14 the House, by a vote of 206 to 90 adopted the bill as presented by the conference committee. The Senate on the following day passed the bill by a vote of 38 to 23. It was vetoed by the President. On August 17 Congress passed the Cotton bill, already favorably acted upon by the House, with many radical amendments. These included an amendment revising the chemical schedule. On the same day the House adopted the report of the committee on the **Farmers' Free List** bill. The President vetoed both measures. On August 18 the House failed to repass the Wool and **Farmers' Free List** bills, and on August 22 there was a similar failure in regard to the Cotton bill.

THE LORIMER CASE. The vote against the resolution declaring the seat of Senator Lorimer vacant, in the previous session, which was noted above, did not put an end to the attempt to expel him from the Senate. On April 6 Senator La Follette introduced a resolution calling for another investigation of the Lorimer bribery charges, and on June 1 the Senate voted to authorize another investigation. There was no serious opposition to the reopening of the case, as new evidence had been developed as the result of an investigation carried on by the Illinois legislature. See **ILLINOIS**.

The resolution offered by Senator La Follette, providing for a special committee for purposes of investigation instead of referring it in the usual course to the committee on privileges and elections, was defeated; and a resolution offered by Senator Martin of Virginia providing for a sub-committee appointed by the committee on privileges and elections was passed with the general understanding that the membership of that committee should be, in accordance with

FOUR UNITED STATES SENATORS PROMINENT IN 1911

the desire of the Senate at large, made up of four members who voted against the unseating of Senator Lorimer and four new senators who had not been called upon to pass on the case. See ILLINOIS.

DIRECT ELECTION OF SENATORS. The bill providing for the direct election of senators, which was not enacted into legislation in the Sixty-first Congress (see above), was reintroduced at the convening of the Sixty-second Congress, and on April 13 the House by a vote of 296 to 16 passed a bill for the direct election of Senators without federal control.

On June 12 the Senate by a vote of 64 to 24 passed a resolution in favor of amending the Constitution in such a manner as would bring about the election of United States senators by direct popular vote after the necessary approval by the legislatures of three-fourths of the States. The Bristow amendment to the resolution providing that the control of senatorial elections shall remain in the hands of the federal government was adopted, but only after a tie vote of 44 to 44 had been broken by Vice-President Sherman. As the House of Representatives had passed the resolution without such an amendment it was necessary for the bill to go into conference so that an agreement might be had. The session of Congress expired before action could be taken on the report of the conference committee. See ELECTORAL REFORM.

CAMPAIGN PUBLICITY BILL. A bill providing for the publicity of campaign expenditures was passed in the House on April 14. On July 17 the bill passed the Senate. For a discussion of this measure see ELECTORAL REFORM.

STATEHOOD BILLS. The general discussion of the legislation by which Arizona and New Mexico were admitted to statehood will be found under those States. The chronological record is as follows: On May 23 the House passed a resolution granting statehood to Arizona and New Mexico, but requiring them to vote again on certain provisions of their constitutions, and on August 8 the Senate passed the resolution with amendment requiring Arizona to vote again on the recall of judges. On August 10 the bill was accepted by the House with the Senate amendments. On August 15 the President vetoed the resolution condemning the recall of judges as "legalized terrorism." The House and Senate thereupon passed an amended resolution requiring New Mexico to simplify the process of amending her constitution, and Arizona to exclude judges from the provisions of the recall.

OTHER MEASURES. Other important acts of the Sixty-second Congress in addition to those mentioned above were the following. On May 9 the House voted to investigate the Post Office Department and the Sugar trust. On July 24 the Senate ratified the fur seal treaty. On August 14 a dissolution of the National Monetary Commission on or before January 8, 1912, was ordered by the Senate. The Senate on August 12 ordered an investigation into the election of Senator Isaac Stephenson of Wisconsin (see WISCONSIN). In addition to the investigations of the Sugar trust and the Post Office Department, inquiries were carried on during the year by committees of Congress in the operations of the Steel Corporation and the action of the President in throwing open the Chugach forest reserve (see ALASKA). For the action of

the Senate on treaties submitted during the session, see *Treaties*.

MR. BRYAN AND MR. UNDERWOOD. An interesting incident as showing the relative degree of power which Mr. W. J. Bryan has, or has ceased to retain in the Democratic party, occurred in the House in August. In an editorial published in his newspaper, *The Commoner*, Mr. Bryan virtually charged Mr. Underwood, the chairman of the committee on ways and means of the House, with attempting to prevent the revision of the iron and steel schedule because his own financial interests were involved in the iron and steel industries. The statement charged Mr. Underwood with preventing the presentation of a revision of these schedules, because of his interest in a steel company in Alabama, and declared that this was well known to several prominent Democratic representatives. Mr. Underwood read this statement to the House and then emphatically declared it to be false. He said that he had stated to the committee when it was first organized that he was willing to take up any schedule for consideration first, but that since he represented an iron and steel district and was interested personally in the manufacture of iron and steel, the committee would save him from embarrassment if they would first take up the iron and steel schedule. Representative Kitchin, who was one of those whom Mr. Bryan had quoted in support of his statement, verified the assertion of Mr. Underwood in regard to what he had told the committee. That the sympathies of the representatives were with Mr. Underwood was shown by the enthusiastic applause which greeted this statement.

CONGRESSIONAL INVESTIGATIONS. An unusual number of investigations was authorized by congressional committees during the sessions of the Sixty-second Congress. The most important of these was the investigation of the United States Steel Corporation, the results of which will be noted in the article on the subject, investigation of the operations of the Sugar trust (see TRUSTS), and investigations into the conduct of the departments of the Treasury, State, War, Navy, Post Office, Interior, Justice, Commerce, and Agriculture. In addition to these, committees were appointed to investigate the methods of the enforcement of the Anti-Trust act and the conduct of the Attorney-General in relation thereto; to investigate the postal service and ascertain specifically the amount of work done by postmasters and officials of the department; to investigate the American Woolen Company, and to investigate the affairs of the Civil Service Commission. These committees carried on their work during the summer and fall of 1911.

CONGRESSIONAL APPROPRIATIONS. The table below shows the amount appropriated in the three sessions of the Sixty-first Congress, covering the fiscal years 1911 and 1912. It will be seen from this table that the total amount appropriated in the first and second sessions was \$663,725,794 and in the third session \$634,549,561, or a total of \$1,268,318,355 for all sessions. Of the amounts appropriated the largest sum was for pensions. Following in order were sundry civil expenses, for the support of the army, for the support of the navy, and for the Rivers and Harbors bill.

Purposes for which made	1st & 2d Ses. 61st Congress, Fiscal yr. 1911	3d Session, 61st Congress Fiscal yr. 1912	No.	Gain
To supply deficiencies in appropriations...	\$ 23,045,612.11	\$ 10,028,526.84	16	2

			433	42

CONGRESSIONAL REAPPORTIONMENT. The census of 1910 made it necessary to provide for a reapportionment for representatives to Congress, and a bill providing for this was passed in the House on April 27.

This provides for 433 members, excluding Arizona and New Mexico, which together will be entitled to three members on the basis of the present population. The ratio of population for representatives is fixed at 211,887, an increase of 17,695 over the ratio previously in force. Under the new apportionment one member each will be gained by the States of Alabama, Colorado, Florida, Georgia, Idaho, Louisiana, Michigan, Minnesota, Montana, North Dakota, Ohio, Oregon, Rhode Island, South Dakota, Utah, and West Virginia. The States of Illinois, Massachusetts, New Jersey, Texas, and Washington each gained two seats. Oklahoma gains three members, Pennsylvania four, and New York six. Under the method embodied in the bill the total membership of the House is reached by dividing the total population of the State by the ratio (211,877) and assigning to each State one representative for each full ratio of population and one in addition for each major fraction thereof. For the representatives of each State according to the new apportionment, see table below.

Under the new apportionment law the 433 members of the House in the Sixty-third Congress will be apportioned among the States as follows:

	No.	Gain
Alabama	10	1
Arkansas	7	None
California	11	3
Colorado	4	1
Connecticut	5	None
Delaware	1	None
Florida	4	1
Georgia	12	1
Idaho	2	1
Illinois	27	2
Indiana	13	None
Iowa	11	None
Kansas	8	None
Kentucky	11	None
Louisiana	8	1
Maine	4	None
Maryland	6	None

SECOND SESSION. The first regular (or second actual) session of the Sixty-second Congress convened on December 4. There were few changes in the personnel of the Senate and the House. In the Senate appeared a new senator from Maine, Obadiah Gardner (q. v.). The failure to choose a senator from Colorado left the total number of members of the Senate 91, of whom 49 were Republicans and 42 Democrats. In the House there were 390 members, of whom 227 were Democrats, 162 Republicans, and 1 Socialist. There was one vacancy in the House membership.

The period between the winter session of Congress and the Christmas holidays is usually filled with routine business of little importance. In the Sixty-second Congress, however, there was an abundance of important business transacted before Congress adjourned for the holidays. A pension bill was passed by the House and steps were taken which led to the abrogation of the treaty of 1832 between Russia and the United States (see *Foreign Relations*), and other important matters were either transacted or set on foot.

Following his custom, the President's message to Congress at the opening of the session was devoted to a single subject. This was accompanied by the announcement that other subjects concerning which he wished to communicate his recommendations to Congress would be treated in other messages to appear from time to time. The first message was devoted to the subject of trusts and was entitled "Message of the President of the United States on the Anti-Trust Statute." It was a careful analysis of the judicial decisions and judicial interpretations of the Sherman law, dwelling at the greatest length on the legal aspect of the question. Beginning at the opinion of the Supreme Court on the Standard Oil and Tobacco cases, he pointed out the distinction between reading the word "reasonable" into the Anti-Trust law so as to make it permit reasonable restraint of trade and applying the law to specific cases in a reasonable way. The latter, he said, is what the court did. It simply exercised reason in determining what constituted restraint of trade. The President declared that

the courts had constantly done this in applying the common law against monopoly. He pointed out that the anti-trust statute as it stands today is a matter of growth; that, while it was not fully understood, juries were unwilling to convict men criminally under it, and judges were unwilling to pronounce sentence. Now that it is more fully understood and men that violate it are more likely to do so knowingly and deliberately, juries will be more ready to apply punishment. He expressed satisfaction at the outcome of the cases, particularly in the case of the Tobacco trust. He apparently believed it desirable to restore competition and that the decree in this case would restore competition. On this point he spoke as follows: "If we shall have by this decree defeated these purposes and restored competition between the large units into which capital and plant have been divided we shall have accomplished the useful purpose of this statute. . . . I venture to say that not in the history of American law has a decree more effective for such a purpose been entered by a court than that against the Tobacco trust." He declared that those who spoke of this disintegration of the trust as a mere change of garments have not given consideration to the inevitable working of the decree and understand little of the personal danger in attempting to evade or set at naught the solemn injunction of a court. From this decree he drew the conclusion that the statute is now clear and that under it trusts can be reorganized without disturbing business. He declared that the statute does not prohibit mere bigness or even merely the elimination of competition. What it does prohibit, he said, is a combination that is made for the purpose of eliminating particular competition in order to control prices and create a monopoly.

In regard to new trust legislation, the President suggested first, the enactment of a law which will describe and denounce unfair methods. These, he said, should be described so particularly that the government could prosecute single acts rather than general conspiracies, and so that the business world could know in advance what it should not do. He suggested, in addition, federal incorporation under the control of an executive bureau or commission. These recommendations he submitted with several new ones. He pointed out that in the Tobacco case the court had the advantage of an expert from the Bureau of Corporations in framing its decree, and he declared that the courts are not provided with suitable administrative machinery for the necessary inquiries preparatory to reorganization and that they should therefore be empowered to invoke the aid of the Bureau of Corporations. He urged still further that corporations which have been incorporated with federal charters shall be subjected to rigid supervision by this executive bureau or commission to which in times of doubt they may well submit their proposed plans for future business. He recommended that this supervision extend to the issue of stocks and bonds and include effective publicity. In the President's opinion federal incorporation should be voluntary. It would not secure immunity from prosecution, but it would offer such publicity and such opportunity for consultation between the corporation and the commission in charge that it would provide as great security against successful prosecutions as would be prac-

ticable or wise. It would give legitimate protection to those corporations that wish to keep within the law and it would place corporations which fail to apply for a federal charter under the suspicion of being unwilling to be supervised.

On December 5 Senator Poindexter of Washington introduced a bill abolishing the federal Court of Commerce. Following the action of this court in enjoining the Interstate Commerce Commission from enforcing its long- and short-haul order, the commercial bodies of southwestern States, which were especially affected, demanded the abolition of the court. See RAILWAYS.

On December 9 the report of the four Democratic members of the House committee on expenditures in the Interior Department, which had been investigating the Controller Bay land controversy, was made to the House. The report in all important essentials exonerated the administration from any blame in the matter. The report was severely criticised for its failure expressly to free the President from blame in the famous letter alleged to have been written by Richard Ryan to Secretary Ballinger (see ALASKA).

On December 12 the Sherwood Pension Service bill, the so-called "Dollar a Day bill," was passed by the House by a vote of 229 to 92. It was estimated that this bill, if it became a law, would add about \$75,000,000 a year to the annual expenses of the government. By the terms of this bill for service of ninety days up to six months, \$15 a month was to be paid; from six to nine months, \$20 a month; from nine months to a year, \$25 a month; and for one year or more, \$30 a month. Several attempts were made to amend the bill, but only two changes of importance were made. One of these eliminated the provision that any veteran receiving \$25 a month under the measure should be ineligible for admission to the Soldiers' Home, and the other struck out the paragraph restricting the benefits of the pension to veterans whose annual net income is less than \$1000 a year.

On December 20 the President sent to Congress a message dealing with tariff reform, together with a summary of the report of the tariff board. A discussion of this message and report will be found in the article **TARIFF**. He also sent a special message in which he approved the main features of the report of the National Monetary Commission (see **FINANCIAL REVIEW**). In this message he pointed out the satisfactory fiscal condition of the government, renewed his recommendation of legislation fixing tolls and the government of the Canal Zone, urged a more systematic method of appropriation for the improvement of the Mississippi and its tributaries, urged legislation to prevent delay and unnecessary expenses in litigation in the federal courts, called for the creation of a rural parcels post for parcels of not more than eleven pounds, and urged that all local officers, such as collectors of internal revenue, customs officers, postmasters, immigration commissioners, and marshals should be transferred to the classified service and taken out of politics. He declared that the postal savings banks had been a success and that their depositors numbered about 150,000, representing forty nations. He recommended the construction of two battleships a year until the Panama Canal is completed in

July, 1913. He also favored an immediate increase of 2000 men in the enlisted strength of the army and the abolition of the smaller navy see *Foreign Relations*.

ADMINISTRATION

The administration of President Taft in 1911 is described in the articles in the *YEAR BOOK* dealing with matters relating to political and economic questions, such as *TRUSTS*; *FINANCIAL REVIEW*; *ARBITRATION*, *INTERNATIONAL*; and in the preceding sections of the present article dealing with Congress and with the work of the different departments of the government. The following notes are intended to cover such events worthy of mention as are not properly treated elsewhere.

On March 7 Richard A. Ballinger resigned as Secretary of the Interior and his resignation was accepted by President Taft. In a letter written to Mr. Ballinger accepting his resignation, President Taft declared that the latter had been the "object of one of the most unscrupulous conspiracies for the defamation of character that history can show," and that the impressions of him as a man and a public officer were the "result of a malicious and unprincipled plan for the use of the press" to misrepresent him. The President continued, "With the hypocritical pretense that they did not accuse you of corruption in order to avoid the necessity that even the worst criminal is entitled to—to wit, that of a definitely formulated charge of some misconduct, they showered you with suspicion, and by the most pettifogging methods exploited to the public matters which had no relevancy to an issue of either corruption or inefficiency in office, but which paraded before a hysterical body of headline readers, served to blacken your character and obscure the proper issue of your honesty and effectiveness as a public servant." From the exchange of correspondence between Mr. Ballinger and the President it appeared that the former had sent in his resignation at an earlier date, but had been urged to remain in office until after the close of Congress. Shortly after the resignation of Secretary Ballinger came the announcement of the appointment of Walter L. Fisher of Chicago as his successor. Mr. Fisher is one of the most prominent citizens of Chicago and has long been identified with the question of conservation.

In March Charles D. Norton, secretary to the President, resigned the office and was succeeded by Charles D. Hilles (q. v.). Mr. Norton resigned to become vice-president of one of the three largest banks in the country. His retirement was expected, as his tenure of the office was only to be temporary and to depend upon the accomplishment of certain specific reforms.

These included the reorganization of the work devolving upon the secretary to the President and the creation of a permanent staff. In order to bring about the latter plan it was necessary to increase the salaries. The new staff is headed by an executive clerk, who has the assistance of a chief clerk and an appointment clerk. A proposal to increase the salary of the secretary to the President from \$8000 to \$10,000 passed the Senate, but in conference with the House the increased salary was reduced from \$10,000 to \$7500.

In the early part of June President Taft delivered two important addresses on the subject of reciprocity with Canada. The first of these was before the Western Economic Society in Chicago, and the second before the Interstate Cottonseed Crushers' Association of New York City. In these addresses the President defined the attitude of the administration in regard to certain amendments to the bill proposed in the Senate. One of these amendments was that proposed by Senator Root, which provided that not until each Canadian province shall have removed all the restrictions upon the exportation of wood from which paper is manufactured shall the United States permit paper from Canada to come in free. Mr. Taft, while admitting that this amendment did not change the character of the bill, declared that the measure should be passed without amendment.

Senator Cummins of Iowa early in September issued a statement containing criticisms of President Taft's administration. This statement, following similar utterances of other insurgent Republican senators, was taken generally as a view of a considerable number of Progressives. Senator Cummins declared that the President had associated himself with reactionaries, or at least not with the Progressives in casting his influence for the Payne-Aldrich bill and commending it as the best bill hitherto passed. He had taken a similar stand in presenting to Congress through the Attorney-General the original draft of the Interstate Commerce bill which, in Senator Cummins's opinion, would have swept away the work of nearly twenty-five years if it had not been amended on the floor of the Senate. He declared that President Taft had used his influence to secure the deposit of postal savings in large city banks rather than in the small country banks, and that his action in substituting a corporation tax for an income tax was not in harmony with the ideas of the Progressives. He asserted that the President had failed to secure a real advance

in international arbitration and that he had erred in vetoing the woolen and free list tariff bills, and the resolution admitting New Mexico and Arizona. Senator Cummins denounced the reciprocity agreement as "false pretense from beginning to end."

On September 15 President Taft started on a tour of the country lasting until November 1. He traversed the whole northern half of the United States from ocean to ocean, including many States in the Middle West. The first speech on this tour was made at Syracuse, N. Y. At Detroit, Mich., he made the first of his prepared speeches, taking for his subject the trust problem. A large part of his speech was devoted to an interpretation or explanation of the decision of the United States Supreme Court in the Tobacco trust case and the effect of the anti-trust law in the light of this decision. In passing the Sherman act, the President said the legislators had hoped to restrain certain evils and relied upon Congress through their construction to prevent the application of the law from becoming so wide as to be impracticable. He declared that the early decisions of the law could not be said to be fortunate. He affirmed that the period of uncertainty in regard to the meaning of the law was passed since the decisions of the Supreme Court in the Standard Oil and Tobacco cases. He pointed out the mistake of those who say that the Supreme Court read the word "reasonable" into the law so as to make it permit reasonable restraints of trade. This, said the President, would imply that the court believed there was monopoly in restraint of trade that could be regarded as reasonable. He declared that this was exactly what the court did not do, and explained the distinction in practical effect, as well as in theory, between the attempt to confine the operation of the act to unreasonable restraint or unreasonable monopoly, and an attempt to read and understand the law in the light of reason. His conclusion was that the Sherman Anti-Trust law needs no amendment, because it has now proved to be effective in preventing a monopoly. "We did get along with competition," said the President; "we can get along with it. We did get along without monopoly; we can get along without it; and the business men of this country must square themselves to that necessity. Either that or we must proceed to State socialism and vest the government with power to run every business." In this speech he urged the subject of federal incorporation, with supervision under an executive bureau of the government. In other speeches in Michigan the President repeated his explanation of the veto of the tariff bills, resting his case chiefly on the fact that intelligent legislation on the tariff must wait on the tariff board. He also defended the arbitration treaties, urged the extension of the civil service law, and treated various other subjects.

In the speech delivered at Waterloo, Ia., President Taft defined the attitude of his administration in regard to the prosecution of illegal trusts. He declared that the managers of great enterprises can expect no cessation of prosecution for the violation of the anti-trust law. He affirmed his belief that business men will make their affairs conform to the law and urged an end to the indiscriminate attacks on business enterprises. He said it was not a progressive policy to be hostile to the prosperity of any part of the country and he made an appeal

to citizens to unite to promote business prosperity by putting down these attacks which, he said, were engendered not by a real desire to eliminate abuses, but by a wish to arouse unjust prejudices. He expressed his conviction that effective control of the railways had been secured; that the Sherman law had been so defined by the courts that the business community could know where it stands, and he affirmed that the court had declined to hold that competition is impossible under modern business conditions, but it insists that it must be given full opportunity for operation, and that any combined effort affecting inter-State trade, looking to its suppression, is contrary to law. He declared further that the foundation has been laid for an intelligent revision of the tariff by the work of the tariff board and that the way to sound financial legislation had been opened by the deliberations of the national monetary committee.

The President reached Denver during the Public Lands convention that was being held in that city. Delegates to this convention were, for the most part, hostile to the policy of conservation. Before the President's arrival they had adopted a resolution condemning the idea that the government, as trustee for the whole people, should own natural resources and lease them to usurers. President Taft addressed this convention and declared emphatically his belief in the leasing system. He told his audience that in opposing this system he believed they were wrong. He also reiterated what he had said at other times that he would like to see provision made for the appeal of land cases from the decision of the Interior Department to the courts; and that he would be willing that the control of the water power sites should be handed over by the federal government to the States, with certain restrictions as to the disposal of the rights of such water powers.

In the latter part of November an authorized interview was given by President Taft to Mr. Francis E. Leupp and was published in the *Outlook*. In this interview the President made what may be considered a defense of his administration. He frankly admitted that he had made mistakes, especially on the occasion of the delivery of his speech on the tariff at Winona, Minn. This was the famous speech in which he declared that the Payne-Aldrich tariff was the best tariff bill ever passed by Congress. This speech he said was dictated on the cars between two stations and was given to the press before he had sufficiently revised it. Nevertheless, the President declared that the tariff bill in effect did reduce the tariff. He pointed out that he induced Senator Aldrich to cut down the cotton schedule 10 per cent., and that by his efforts hides were placed on the free list and lower duties were secured on coal, iron ore, and scrap iron. He admitted that he should have made a stronger point for the reduction of tariff on paper as he did in the case of hides. His failure to secure a lower duty on lumber he attributed largely to the influence of Gifford Pinchot who, he declared, threw his influence into the scale for the retention of the \$2 duty on lumber instead of backing a general effort to put it on the free list. As for the future programme of the administration, the President declared his belief on principle in a general income tax, and said that he would not resort to the ordinary income tax except in an emergency like war, when he would have it graduate so that the

citizens who had most at stake would bear a correspondingly large share of the burden. He indicated his belief that reductions in the woolen and cotton schedules and possibly in the metal schedules of the tariff would be the first work of the Sixty-second Congress. These reductions as far as his recommendations were concerned would, he said, be based on the report of the tariff board. He declared it of the first importance to obtain legislation which would enable Alaska to develop without infringing upon the broad policies of conservation. Other important measures which he mentioned were the question of ratifying the peace treaties with England and France, and the fiscal treaties with Honduras and Nicaragua. In regard to his second term, the President said that while he would welcome nomination and election for another term as President, he was not willing and had not been willing to "purchase it at the sacrifice of his freedom to do his duty as he sees it"; rather than that he would retire to private life.

NOVEMBER ELECTIONS

This summary of the elections held on November 7 is general in its nature. More detailed accounts of the elections held in the various States will be found in the political sections under those States.

From a national standpoint the elections were of importance as indicating the trend in political affairs. There were no candidates for federal office, and in many States there were no elections of State officials or legislatures. There were, however, many important municipal elections which attracted more than local attention and interest.

In Massachusetts, Rhode Island, and Kentucky certain prominence was given to the tariff issues, but in nearly all the other States local questions overshadowed national. In Massachusetts Governor Foss was reelected, defeating Frothingham, the Republican candidate. Mr. Foss's plurality was reduced somewhat, but this loss is attributed to criticism of his course in office. For the second time since the Civil War Maryland elected a Republican governor. The legislature, however, remained Democratic. The elections in Ohio were perhaps the most interesting and came nearest to being identified with national issues, chiefly for the reason that Mr. Cox, Republican leader in Cincinnati, had the practical indorsement of President Taft. He was defeated by Henry T. Hunt, Democrat. In 1905, in a speech at Akron, Mr. Taft, then Secretary of State, sharply denounced the Cox machine, calling it "a local despotism," and urging the citizens to vote against it. He was therefore sharply criticised for supporting a candidate whom he had denounced six years previously. The general drift of the voting in Ohio was Democratic or Socialistic. In eleven cities Socialist mayors were chosen (see OHIO).

In New York the elections were for members of the legislature and minor officers. As a result the Democratic legislature, elected in 1910, was succeeded by an assembly in which there will be 101 Republicans and 48 Democrats. This result was generally attributed to opposition to Charles F. Murphy, the leader of Tammany Hall, who was charged with having unduly influenced Governor Dix. In New York City the Democrats lost control of the board of aldermen

and elected county officers and judges by only a small majority.

The result in New Jersey was of unusual interest owing to the prominence of Governor Woodrow Wilson as a candidate for the presidential nomination. The legislature, which in 1910 was Democratic by a majority of 21, was succeeded by a Republican majority of 15. The change was due chiefly to the influence of Democrats who opposed the advanced views of Governor Wilson.

The result of the first State election in New Mexico was somewhat in the nature of a surprise. It was generally believed that the voters of the new State would indorse the administration, particularly as the Territory had been heretofore Republican and was admitted to statehood under Republican auspices. Through a coalition of Democrats and Progressive Republicans the Republican candidate for governor was defeated and the Republican plan of rendering the New Mexico constitution difficult of amendment was rejected (see NEW MEXICO).

The election in Kentucky resulted in the return of a State normally Democratic to its party, after four years under a Republican governor.

Municipal elections throughout the country showed an increasing spirit of independence in questions involving local administration. In Cleveland, Newton D. Baker, a former colleague of Mayor T. L. Johnson, was chosen mayor in Cincinnati. The Cox machine, as noted above, was overthrown. In San Francisco the labor union forces were driven from power. Salt Lake City, and Lowell and Lawrence in Massachusetts adopted the commission form of government. The city of Chelsea, Massachusetts, on the other hand, voted against the commission form of government after having given it a trial. The result in Philadelphia was perhaps more significant than in any other city. After years of rule by an alleged corrupt Republican ring, the voters elected to office an avowed reformer, Rudolph Blankenburg. The most important result of the voting was probably the remarkable gains made by the Socialist party. In Ohio, as mentioned above, 11 cities elected Socialist mayors. Four of the nineteen councilmen of Columbus are Socialist. In Schenectady, N. Y., a city with a population of 72,000, the Socialists elected their candidate, Rev. George R. Lunn. A majority of the councilmen and nearly all the other city officers are also Socialists. In Rhode Island a Socialist was elected to the legislature. Socialist mayors were chosen in Newcastle, Pa., Crookston, Minn., and in five smaller cities in Utah. In New York City it is estimated that the party growth of the Socialists was 42 per cent., 100 per cent. in Buffalo and Pittsburgh, and 600 per cent. in Bridgeport, Conn. It is probable that not all those who voted the Socialist ticket were Socialists. In some places men of one or the other of the old parties supported a Socialist candidate for the accomplishment of some political purpose. The increase in the Socialist vote was, however, none the less significant.

As an indication of the drift of politics in 1912 the election as a whole gave little light. The fortunes of no candidate for the presidential nomination were greatly promoted. In the main, the voters disregarded national politics and based their votes on local issues.

CAMPAIGN OF 1912

Preparations for the presidential campaign of 1912 had by the end of 1911 assumed considerable proportions. Only President Taft and Senator La Follette of Wisconsin had declared themselves to be in the field as Republican candidates. The attitude of Theodore Roosevelt on the question of renomination was much discussed, although Mr. Roosevelt had refused to commit himself. In relation to his possible position, the declaration made at the time of his election to the presidency on November 8, 1904, and reaffirmed in 1907, is of interest. This declaration was as follows: "On the 4th of March next I shall have served three and a half years, and this three and a half years constitutes my first term. The wise custom which limits the President to two terms regards the substance and not the form, and under no circumstances will I be a candidate or accept another nomination."

Of the Democratic candidates the most conspicuous at the end of the year was Governor Woodrow Wilson of New Jersey. He had openly declared himself a candidate and apparently had developed considerable support. Other candidates more or less conspicuous were Champ Clark, Speaker of the House of Representatives, Governor Harmon of Ohio, James W. Folk, former governor of Missouri, and Thomas R. Marshall, governor of Indiana.

For the support of Senator La Follette, an organization known as the National Progressive Republican League was organized early in 1911, under the leadership of Senator Bourne of Oregon, who was elected president. The organizers of the league included, in addition to nearly all the insurgent United States senators, Louis Brandeis, Ray Stannard Baker, Charles R. Crane, Francis J. Heney, Gifford Pinchot, William Allen White, and other advocates of progressive measures. While the organization did not positively pledge itself to the support of any candidate, it declared at a conference held later in the year that Senator La Follette was the logical candidate for President of the United States on account of his experience, character, courage, his record of constructive legislation and administrative ability. The reforms indorsed by the league included direct primaries, popular election of delegates to the national conventions, election of United States senators by the people, the referendum, initiative, and recall, and an effective corrupt practices act. Senator La Follette formally inaugurated his campaign for nomination by the delivery of two speeches in Ohio in December. One of these was on "Self-Government and the Trusts" and the other on "Courts and Labor Combinations under the Restriction of the Sherman Anti-Trust Law." His speechmaking tour included cities in Michigan, Indiana, and Illinois.

The Republican National Committee met in Washington on December 12 to choose the place of the Republican National Convention of 1912. It was decided that the convention should be held in Chicago on June 18. An attempt to have presidential primaries held in States in which such elections were authorized to be held was voted down by the committee, much to the disappointment of the progressive politicians who urged such action. A sensation of the meeting was the declaration by E. F. Lee, of the State committee of Indiana, to

the effect that Mr. Taft could not carry that State. This assertion was made in a formal statement issued at the close of the meeting. It was contradicted by Harry S. New, who was elected at the meeting as a committeeman from Indiana. Mr. Lee is a strong supporter of Mr. Beveridge of Indiana. Postmaster-General Hitchcock resigned as chairman of the national committee, and John A. Hill, former governor of Maine, who had been acting chairman since 1909, was elected chairman until the selection of Mr. Taft's campaign manager if the President is renominated.

FOREIGN RELATIONS

The foreign relations of the United States during 1911 concerned chiefly those countries in the immediate proximity. The attempt to bring about a reciprocity agreement with CANADA is described in detail in the article *TARIFF*, in the section *Congress in UNITED STATES*, and in the article *CANADA*. In addition to the reciprocity agreement the State Department announced on January 14 that a complete agreement had been reached with Canada over the fisheries question. The rebellion in Mexico, which resulted in the retirement of President Diaz and the succession of President Madero, brought about complications with the United States along the border between Texas and Mexico. The conditions in Mexico had for several months previous given alarm and the United States ambassador to Mexico had acquainted President Taft with the possibility of an outbreak. As a result of his knowledge of the conditions, the President ordered an army division of full strength to be mobilized at San Antonio, Tex., a brigade of three regiments at Galveston, a brigade of infantry in the Los Angeles district of southern California, and a squadron of battleships, cruisers, and transports at Galveston, and a small squadron of ships at San Diego. During the fighting at Juárez, just across the border from El Paso, Tex., the firing by Mexican troops caused the death of several American citizens and the injury of many others. Similar conditions existed at Douglas and Agua Prieta, Ariz. Several citizens were killed and many injured in these towns.

President Taft found it necessary in April to make representations to the Mexican government to the effect that affairs like those at Douglas and Agua Prieta must not be repeated. Formal warnings were at the same time issued to the federal and insurrecto commanders that they would be held to a strict observance of the neutrality law. The President asked for immediate assurances that there should be no more fighting that might endanger Americans in the border towns. Information was also requested as to what measures the federal authorities had already taken to prevent further combats of this kind. President Diaz on April 18 informed Ambassador Wilson that Mexico would observe "a distinct restrictive policy hereafter for the zone of hostilities along the international border." The official reply of the Mexican government to President Taft's note was received two days later. While it was friendly in form and substance, it laid at the door of American citizens much of the responsibility for the injuries complained of by the President. It was claimed that the insurrectos purposely took positions which forced the federal troops, in

attacking them, to fire into American territory, and it was also charged that Americans were not keeping away from the line of fire. As a result of this prompt action taken by the President care was taken by both insurgents and regular troops that there should be no further firing into American territory. Following the inauguration of President Madero a plot was unearthed against the government to begin a new insurrection and evidence was accumulated that Gen. Bernardo Reyes and others were perfecting plots at El Paso, Tex., to overturn the government. General Reyes and a number of officers and men were seized by United States authorities and handed over to Mexican officials.

On June 15 a decision was reached in the long-standing Chamizal boundary dispute between the United States and Mexico. On that date the International Arbitration Court, which had been sitting at El Paso for a month discussing the ownership of some 600 acres of land, involving \$7,000,000 of property, inhabited by 6000 people, rendered a decision. Mexico was represented by one arbitrator, the United States by one, and the third member was a Canadian jurist. The arbitrators gave part of the land to Mexico and part to the United States. The dispute originally arose out of a change in the course of the Rio Grande River seventeen years ago. The commissioners found, in substance, that up to a certain point, the lands on the El Paso side of the river grew by accretion, but that at another period there was a sudden "cut off" by the river of a considerable portion of Mexican territory. The decision was made that the lands gained by accretion belonged to America, while the lands suddenly cut off from Mexico belonged to the latter country. This decision was a compromise and both countries dissented. It seemed probable that the case would be reargued.

On April 26 President Diaz set free the Americans, Blatt, Converse, and Brown. These men had been for two months in a Mexican jail, charged with giving aid to the insurgents. They were released at the request of President Taft.

For the conventions signed between the United States and Nicaragua and Honduras, see above, *Treaties*.

The Alsop claim, a question long pending between the United States and Chile, was settled by King George of England acting as arbitrator in July. See CHILE, *History*.

Foreign relations with countries in Europe were friendly during the year and good feeling between the United States, France, and Great Britain was promoted by the effort to arrange arbitration treaties between these countries and the United States. Arrangement was made with Great Britain to settle all outstanding differences in addition to those already settled by treaties made in previous years, and on April 3 Great Britain and the United States agreed to arbitrate the Webster claim, involving the ownership of several millions of acres of land in New Zealand.

The agitation which has gone on for years against the action of Russia in forbidding within her territories American citizens of Jewish descent reached a culmination in December and resulted in the abrogation of the treaty of 1832 by President Taft. Although the question had been discussed for years and protests had been made by American representatives to Russia through succeeding secretaries of state, it has been impossible to obtain modification of the

Russian interpretation of the law that would allow Jewish citizens of the United States equal rights with others. In the early part of December a large and important meeting was held in New York City, which was addressed by prominent judges and others, nearly all of whom demanded that Russia should be punished by denouncing and annulling the treaty of 1832 on the ground that she had failed to live up to its engagements. Article I of this treaty reads as follows: "There shall be between the territories of the high contracting parties a reciprocal liberty of commerce and navigation. The inhabitants of their respective states shall mutually have liberty to enter the ports, places, and rivers of each party wherever foreign commerce is permitted. They shall be at liberty to sojourn and reside in all parts whatsoever of said territories in order to attend to their affairs, and they shall enjoy, to that effect, the same security and protection as natives of the country wherein they reside, on condition of their submitting to the laws and ordinances there, prevailing, and particularly to the regulations in force concerning commerce." The President in the message to Congress dealing with foreign relations stated that an attempt was being made to replace this treaty with a new one which would be more explicit. In the meantime, however, the resolution had been introduced into the House by Representative Sulzer of New York, providing for the abrogation of the treaty of 1832 with Russia because of discrimination by the Russian government against Hebrews of American citizenship and the honoring of American passports. This resolution was passed by a vote of 300 to 1. The resolution passed read as follows: "That the people of the United States assert as a fundamental principle that the rights of its citizens shall not be impaired at home or abroad because of race or religion; that the government of the United States concludes its treaties for the equal protection of all classes of its citizens without regard to race or religion; that the government of the United States will not be a party to any treaty which discriminates, or which by one of the parties thereto is so construed as to discriminate between American citizens on the ground of race or religion; that the government of Russia has violated the treaty of 1832, refusing to honor American passports duly issued to American citizens on account of race and religion; that in the judgment of Congress the said treaty for reasons aforesaid ought to be terminated at the earliest time; that for the aforesaid reasons the said treaty is hereby declared to be terminated and of no further force and effect from the expiration of one year after the date of notification of the government of Russia of the terms of this resolution and that to this end the President is hereby charged with the duty of communicating such notice to the government of Russia. The Russian government informed the State Department informally following the passage of this resolution that it was offensive to Russia. While the right of the United States to abrogate the existing treaty was not questioned, objection was taken to the wording of the resolution. An alleged inconsistency was pointed out in that the United States did not hesitate to exclude Orientals as "undesirables." The Senate committee on foreign relations refused to adopt the Sulzer resolution, but prepared instead a substitute, which was unanimously adopted by the Senate on

cember 19. Previous to this, however, on December 15, President Taft had already notified Russia of the intention of the United States to abrogate the treaty of 1832, and on December 17 this notice was served on the Russian government by the American ambassador. The resolution adopted by the Senate was practically a confirmation of the action of the President. On December 20 the House concurred in the Senate resolution without a dissenting vote. The revised resolution is as follows:

"Whereas, the treaty of commerce and navigation between the United States and Russia, concluded on the 18th day of December, 1832, provides in Article XII. thereof that it shall continue in force until the first day of January in the year of our Lord 1839 and if, one year before that date one of the high contracting parties shall not have announced to the other by an official notification its intention to arrest the operation thereof, this treaty shall remain obligatory one year beyond that date and so on until the expiration of the year which shall commence after the date of a similar notification, and

"Whereas, on the 17th day of December, 1911, the President caused to be delivered to the imperial Russian government by the American ambassador at St. Petersburg an official notification in behalf of the government of the United States announcing the intention to terminate the operation of this treaty upon the expiration of the year commencing the first of January, 1912, and,

"Whereas, said treaty is no longer responsive in various respects to the political principles and commercial needs of the two countries, and,

"Whereas, the construction placed thereon by the contracting parties differs upon matters of fundamental importance and interest to each, therefore be it

"Resolved, by the Senate and House of Representatives of the United States of America in Congress assembled that the notice just given by the President of the United States to the government of the empire of Russia to terminate said treaty in accordance with terms of said treaty is hereby adopted and ratified."

The abrogation of this treaty was received with considerable bitterness in Russia. The suggestion of the United States government that a new treaty should be made was met with the assertion that it was not practicable at the present time to enter into the matter (see *RUSSIA*).

Important matters were at issue during the year in the Far East and in these the United States had an interest. The uprising in China made it necessary for United States troops to be hurried from the Philippines to that country to protect American interests. During the year two important international loans in China in which the United States participated were brought to a conclusion. One of these was for the construction of the Hukuang Railway and

the other for the carrying out of the currency reforms to which China was pledged by treaties with the United States, Great Britain, and Japan. The signing of the fur seal treaty by the United States, Great Britain, Japan, and Russia is noted above in the paragraphs on *Treaties*.

UNITED STATES CENSUS. The work of the Census Bureau in 1911 was devoted to completing the population returns, which were left unfinished in 1910, and to the preparation of statistics relating to agriculture and manufactures. The results of the agricultural census will be found in the article *AGRICULTURE* and in the articles on the States, paragraph *Agriculture*. The statistics of manufactures will be found in the articles dealing with manufactures, and, so far as completed for the separate States during 1911, in the State articles.

It is expected that the work of the census on manufactures, agriculture, and population, with certain exceptions, will be completed on June 30, 1912, and that the results in the form of abstract-bulletins will be published by two or three months after that time. More detailed volumes covering the same subjects will probably be issued by January 1, 1913. It was necessary to defer the work on certain subjects until after July 1, 1912, on account of shortage of appropriations. These subjects include occupations, ownership of homes, statistics of institutions for the defective, dependent, and delinquent, and analyses of agricultural statistics according to tenure, color of farmer, and size of farm.

WHITE AND NEGRO POPULATION IN THE UNITED STATES

The Census Bureau issued during 1911 several interesting bulletins relating to the distribution and classification of population. The first of these related to the white and negro population of the United States on the date of the Thirteenth Census, April 15, 1910, and the results of this classification are noted in the following paragraphs. The figures were prepared under the supervision of Mr. William C. Hunt, chief statistician for population in the Bureau of the Census, and are subject to later revision.

According to the returns of the Thirteenth Census, the population of continental United States (that is, excluding Alaska, Porto Rico, and other outlying possessions), which was 91,972,266 in 1910, is subdivided as to color, as follows: White, 81,732,687, or 88.9 per cent.; negro, 9,828,294, or 10.7 per cent.; all other persons (Indians, Chinese, Japanese, etc.), 411,285, or 0.4 per cent. These figures for 1910 are compared with similar figures for each of the three preceding federal censuses in Table No. 1 below.

TABLE I.

Census year	Total	White	Negro	All other ¹	Per cent. of total		
					White	Negro	All other ¹
1910	91,972,266	81,732,687	9,828,294	441,285	88.9	10.7	0.4
1900	75,994,576	66,809,196	8,833,994	351,385	87.9	11.6	0.5
1890	62,947,714	55,101,258	7,488,676	357,780	87.5	11.9	0.6
1880	50,155,783	43,402,970	6,580,793	172,020	86.5	13.1	20.3

¹ Indians, Chinese, Japanese, etc.

² Enumeration in 1880 did not cover all Indians, as at later

At each succeeding federal census here considered, the white population has constituted a what larger percentage of the total popula-

tion, with a corresponding decrease in the percentage for the negro population. The whites now constitute 88.9 per cent. of the total popu-

lation, as compared with 86.5 per cent. in 1880, whereas, the negroes now constitute only 10.7 per cent. of the total population, as compared with 13.1 per cent. in 1880.

The following table shows the decennial increase in the white and negro population of continental United States since 1880. In figuring the increase from 1880 to 1890, the population (117,369 whites and 18,636 negroes) specially enumerated in Indian Territory and on Indian reservations in 1890 is excluded, as similar figures for 1880 are not available.

TABLE II.

Decade	Increase in white		Increase in negro	
	Number	Per cent.	Number	Per cent.
1900-1910	14,923,491	22.3	994,300	11.3
1890-1900	11,707,938	21.2	1,345,318	18.0
1880-1890	11,580,920	26.7	889,247	13.5

IMMIGRATION IN RELATION TO WHITE INCREASE. There has been an increase in white population since 1900 of 14,923,491, or 22.3 per cent., as compared with an increase in negro population of 994,300, or 11.3 per cent. The excess in the percentage of increase for the whites is due in part to the large immigration of foreign-born whites during the decade. There is practically no immigration of negroes.

It is possible, however, to determine approximately what the increase of the white population would have been apart from immigration. From a preliminary tabulation the Census Bureau has ascertained that of the entire number of foreign-born white persons who were enumerated at the Thirteenth Census, about 5,000,000, or 37 per cent., were reported as having come to this country since 1900. If this number is deducted from the increase in the white population, the latter then becomes less than 10,000,000, instead of 14,923,491, while the percentage of increase is not quite 15 per cent., instead of 22.3 per cent. This figure, 15 per cent., is fairly comparable with the 11.3 per cent. by which the negroes increased, since each percentage may be accepted as representing approximately the natural rate of increase—that is, the increase resulting from the excess of births over deaths.

In making these computations, however, no allowance has been made for native white persons who may have emigrated from the United States. But, as against this, no allowance either has been made for the children born in this country whose parents have come to this

country since 1900, and who almost certainly exceed the number of emigrants.

DECREASING RATE OF INCREASE OF WHITES, EXCLUSIVE OF IMMIGRANTS. Similar figures for the preceding decade, 1890-1900, show that at the census of 1900 there were about 2,570,000 foreign white persons then reported as having been in the United States less than ten years; excluding this number, the increase in the white population from 1890 to 1900 would have been about 9,130,000, instead of 11,707,938, or slightly more than 16 per cent. The percentage of increase for the white population, excluding immigrants, was thus less from 1900 to 1910 than from 1890 to 1900, whereas, for the total white population the rate was higher in the later decade than in the earlier. No similar tabulation regarding length of residence in the United States was made at the census of 1890, and so no direct computations for the decade 1880-1890 can be made, but rough estimates indicate that the increase in the white population, exclusive of immigrants, from 1880 to 1890 was less than 20 per cent., but higher than from 1890 to 1900.

Excluding immigrants the rate of increase of whites has decreased during each decade.

THE PERCENTAGE OF INCREASE IN NEGRO POPULATION. As against these changes in the percentages of increase for the white population, the census shows for the negro population an increase of 11.3 per cent. from 1900 to 1910, as compared with an increase, on the face of the returns, of 18 per cent. from 1890 to 1900, and of 13.5 per cent. from 1880 to 1890. That the rate for 1890 to 1900 should greatly exceed that for the preceding decade and also that for the following decade seems improbable on general principles, and it has been contended by certain statistical writers that it is indicative of a deficient enumeration of the negro population in 1890.

However that may be, these computations show conclusively that the higher rate of increase for the white population, as compared with the negro during the period under review, is not wholly due to the effects of immigration. The natural increase of the white population is on the whole noticeably greater than that of the negro.

WHITE AND NEGRO POPULATION PROPORTIONS IN THE SOUTH. Table No. 3 shows the total population of the South, and the proportion of white and negro, respectively, at each of the last four federal censuses.

TABLE III.

Census year	Total	White	Negro	All other ¹	Per cent. of total		
					White	Negro	All other ¹
1910	29,389,230	20,547,573	8,749,390	92,367	69.9	29.8	0.3
1900	24,523,527	16,521,970	7,922,969	78,588	67.4	32.3	0.3
1890	20,028,059	13,193,453	6,760,577	74,029	65.9	33.8	0.4
1880	16,516,568	10,555,427	5,963,908	7,238	63.9	36.0	(2)

¹ Indians, Chinese, Japanese, etc. ² Less than one-tenth of 1 per cent.; enumeration in 1880 did not cover all Indians, as at later censuses.

Of the total population of the South in 1910, shown by this table, the whites constituted 9 per cent. and the negroes 29.8 per cent., as varied with 67.4 and 32.3 per cent., respectively, in 1900, and with 63.9 and 36 per cent., respectively, in 1880. The gain since 1880 in proportion of the white population of the South is the result largely of higher natural increase among whites than negroes, although to some extent due to the migration of negroes to States outside the South. Neither

interstate migration nor immigration from foreign countries has added very largely to the white population of the South. The natural increase of the white population is found to be considerably higher in the South than it is in the North.

During the last decade, 1900-1910, the white population of the South increased 4,025,603, or 24.4 per cent., as compared with an increase of 826,421, or 10.4 per cent., for the negro population of the South.

CONDITIONS IN THE COUNTRY OUTSIDE OF THE SOUTH. For the remainder of the country outside of the South there has been an increase in white population during the decade from 50,287,226 to 61,185,114, the growth thus being 10,897,888, or 21.7 per cent. Negro population outside the South has grown from 911,025 to 1,078,904, i. e., 167,879, or 18.4 per cent.

As already explained, the increase of the white population in the North and West is largely

influenced by foreign immigration, while the increase of the negro population in those sections is in part the result of the migration of negroes from the South.

DETAILS FOR THE SOUTH, BY STATES. The statistics of the white and negro population of the South, based upon the returns of the censuses of 1910 and 1900, are presented in detail by States in Table No. 4.

This summary shows, first, that in South Caro-

¹ Decrease. ² Includes Indian Territory.

lina and Mississippi the negroes exceeded the whites at both censuses, although the proportion in 1910 is somewhat smaller than in 1900; and, second, that in West Virginia, Arkansas, and Oklahoma the negroes constituted a slightly larger proportion of the total population in 1910 than in 1900, principally as the result of the migration of negroes from other States.

This table shows further that in every Southern State, with the exception of West Virginia, Arkansas, and Oklahoma, the whites had a higher rate of increase than the negroes.

In Maryland, Kentucky, and Tennessee there has been since 1900 an actual decrease in the number of negroes; and in Delaware and Virginia there has been only a slight increase in negroes, namely, 1.6 per cent. in each case. These are all border States, and the facts stated are doubtless due largely to the migration of negroes from those States, partly, perhaps, to the more southerly States, but more particularly to States entirely outside of the South.

The full significance of the changes in the relative numbers of the two races in the South cannot be definitely stated until more complete statistics are available, particularly those showing the interstate migration of the native-born population.

ELEMENTS OF THE POPULATION OF THE UNITED STATES

The second bulletin analyzes the elements of the population of the United States. The results of this analysis are shown below:

The statement below distributes the white population with respect to native or foreign birth, and for the native white, distinguishes those having native-born parents from those having foreign-born parents. The statistics were prepared under the supervision of Mr. William C. Hunt, chief statistician for population in the Bureau of the Census, and are subject to later revision.

The white population, taken as a whole, has constituted at each census a slightly larger percentage of the total population, with a corresponding decrease in the percentage for the negro population, at each succeeding federal census since and including that of 1880. The number and proportion of the total population for each of the elements of the white population, as well as for the total negro population and the total other colored population (Indians, and Chinese, Japanese, and other Asiatics), are shown for the same censuses in Table No. 5.

¹ Indians, and Chinese, Japanese, and other Asiatics.

NATIVE WHITE AND FOREIGN-BORN WHITE PROPORTIONS. Of the total population of continental United States—that is, excluding Alaska, Porto Rico, and other outlying possessions—in 1910, the native white element, numbering 68,389,104, constituted 74.4 per cent., while the foreign-born white element, numbering 13,343,583, constituted 14.5 per cent. The native white proportion in 1910 was almost the same as in 1900, but slightly larger than in 1890 or 1880. The foreign-born white population constituted 13.1 per cent. of the total in 1880, rose to 14.5 per cent. in 1890, fell to 13.4 per cent. in 1900, and was again 14.5 per cent. in 1910. These fluctuations were due to the very large immigration from 1880 to 1890 and again from 1900 to 1910.

Of the entire white population in 1910, namely, 81,732,687, the foreign-born whites constituted 16.3 per cent., as compared with 15.3 per cent. in 1900, 16.8 per cent. in 1890, and 15.1 per cent. in 1880.

For the last three federal censuses the native white population has been further subdivided with respect to parentage. Those classed as having native parents are persons with both parents native; those having one or both parents foreign born are classed as of foreign parentage. Table No. 5 shows that in 1910 the native white population having both parents native numbered 49,488,441, while those having one or both parents foreign born numbered 18,

900,663, or 53.8 and 20.6 per cent., respectively, of the total population of the country at that census. These proportions are practically the same as those shown by the census of 1900, but, as compared with 1890, there has been a slight decrease—from 54.7 to 53.8 per cent.—in the proportion of native white persons of native parentage, and a considerable increase—from 18.3 to 20.6 per cent.—in the proportion of native white persons of foreign parentage. The latter class constituted 27.6 per cent. of the total native white population in both 1910 and in 1900, as compared with 25 per cent. in 1890.

DECENNIAL INCREASE IN THE MAIN ELEMENTS. Table No. 6 shows the decennial increase in each of the main elements of the population of continental United States since 1880. In figuring the increase from 1880 to 1890 the population (325,464) specially enumerated in Indian Territory and on Indian reservations in 1890 is excluded, as the corresponding population for 1880 was not enumerated. It should be borne in mind that, except for the negro population, which is not appreciably affected by immigration, none of these percentages of increase represent natural increase from excess of births over deaths. Thus the native white persons of native parentage for 1910 include not merely the children born since 1900 as the offspring of the class of native white of native parents, but also as the offspring of the class of the native white persons of foreign parentage.

TABLE VI.

General Nativity and Color	Increase, 1900-1910		Increase, 1890-1900		Increase, 1880-1890	
	Number	P.C.	Number	P.C.	Number	P.C.

All other ¹	59,900	17.0	2 6,395	2 1.8	2 3,700	2 2.2
¹ Indians, and Chinese, Japanese and other Asiatics. ² Decrease.						

THE NATURAL RATE OF INCREASE. Since 1900 the white population as a whole, as shown by a preliminary statement issued recently by the Census Bureau, has increased 22.3 per cent., as compared with an increase in the negro population of 11.3 per cent., the excess in the percentage of increase for the whites being due in part, as then explained, to the large immigration of foreign-born whites during the decade. It was also estimated in the same statement that the increase in the white population, apart from immigration, would have been not quite 15 per cent., representing approximately, though not precisely, the natural rate of increase. It was further stated that the apparently very marked falling off in the percentage of increase of the negro population during the decade 1900-1910, as compared with the preceding decade, is possibly due to an undercount of the negroes in 1890.

It is not possible to determine the extent to which the increase in each element of the white population is due to natural increase from excess of births over deaths, but, in judging the significance of the percentages shown in Table No. 6 consideration should be given to the difference between the actual and modified percentages of increase just presented for the white population as a whole.

GRADUAL DECLINE IN NATIVE WHITE RATE OF INCREASE. Disregarding the question as to the source of the increase, Table No. 6 shows that the native white population has increased 20.8 per cent. since 1900, as compared with a gain of 23.1 per cent. from 1890 to 1900 and of 24.5 per cent. from 1880 to 1890; there being a gradual decline in the rate of increase from decade to decade. In the foreign-born white population, on the other hand, there has been an increase of 30.6 per cent. since 1900, as compared with a gain of only 12 per cent. from 1890 to 1900 and of very nearly 40 per cent. (39.1) from 1880 to 1890; these differences arising from the fluctuations in the number of immigrants during the three decades in question.

The native whites of native parents and those of foreign-born parents increased at substantially the same rate during the last decade, 1900-1910, but in the preceding decade, 1890-1900, the rates of increase for the two elements differed materially. For the native white element of native parentage, as shown by Table No. 6 the rate of increase from 1900 to 1910 is considerably higher than that from 1890 to 1900, namely, 20.9, as against 18.8 per cent., whereas for the native white element of foreign parentage the rate of increase for the last decade is very much less than that for the pre-

ceding decade, or 20.8, as against 36 per cent. These variations in the rates of increase for the two decades are largely the result of the difference in the amount of immigration at different periods, as affecting primarily the number of native white persons reported as having one or both parents foreign born and ultimately the number of native white persons reported as having both parents native born.

An interesting bulletin giving the proportion of males and females in the population shows the following results:

MALES AND FEMALES IN THE POPULATION

In the United States as a whole there are 47,332,122 males and 44,640,144 females, or a

proportion of 106 males for every 100 females. Considerable interest attaches to the deviation from the numerical equality of the two sexes here noted. While it is commonly assumed that the two sexes are equal in number, the fact is that there is always a slight difference between them. Most northern European countries show an excess of females. The contrary fact in the United States has been generally ascribed to the effects of immigration, as it is well known that among immigrants males predominate to a large extent. This is not the full explanation, as can be seen from a consideration of the figures by elements of the population as shown in Table No. 7.

TABLE VII.

General Nativity and Color	1910		Males per 100 females	1900		Males per 100 females
	Males	Females		Males	Females	
Total population	47,332,122	44,640,144	106.0	38,816,448	37,178,127	104.4
Native white:						
Native parents	25,229,294	24,259,147	104.0	20,849,847	20,099,515	103.7
Foreign parents	9,487,063	9,473,610	99.5	7,336,603	7,809,414	100.3
Foreign white	7,522,445	5,821,138	129.2	5,515,285	4,698,532	117.4
Negro	4,886,358	4,941,936	98.9	4,886,547	4,447,447	98.6
All other	266,972	144,313	185.0	228,166	123,219	185.2

THE EXCESS OF MALES. Among the foreign white there are 129.2 males for every 100 females, this proportion reflecting the familiar fact already noted with respect to the excess of males among immigrants.

But this excess of males is also found in the largest single group of the population of the United States—the native white of native parents. Of the latter there are 25,229,294 males and 24,259,147 females, or a proportion of 104 males for every 100 females. This disparity is due wholly to natural causes; the only other cause which could affect it is emigration from the United States, and such emigration is small and is certainly not greater in case of females than in case of males.

In the next group—the native white of foreign parents—the numbers of the two sexes are almost equal, with a slight excess of females.

Among the negroes, however, there is a more noticeable preponderance of females, 98.9 males to 100 females.

The small group "All other" in which there are nearly twice as many males as females is composed of Indians and immigrant Asiatics, the latter being mainly male.

Due in large measure to the effects of recent immigration, the proportion of males for 100 females in the population as a whole has risen slightly between 1900 and 1910, namely, from 104.4 to 106. The proportions of the sexes in the several native-born groups have not changed materially.

WHY THERE ARE MORE MALES. At birth the number of males always exceeds the number of females, but male mortality is always greater than female. Consequently, through the excess

of male deaths, the number of females gradually approaches that of males and in the later years of life exceeds it. In countries where the death rate is high an equality is reached at a comparatively early age, and the subsequent inequality in favor of the females outweighs the previous inequality in favor of the males, so that in the population as a whole there are more females than males. In the United States there is generally a lower death rate than in northern European countries, and the difference between the death rates of males and females is not so marked. The equality in the number of the sexes occurs here at a later age than in European countries, and the slightly greater male death rate does not overcome the initial advantage which the males have at birth. The result is for the native white population of the United States generally an excess of males. For the native white of foreign parents, where the conditions with respect to mortality are not so favorable, the result is as shown by Table No. 7, that the two sexes are almost identical in number, with, in fact, a slight preponderance of females in 1910, as against a slight excess of males in 1900. On the other hand, the negroes, with their greater death rate, show the same result as is observed in European countries, namely, an appreciable excess of females in the population both in 1910 and 1900.

IN THE GEOGRAPHIC DIVISIONS. If the numbers of males and females in the several geographic divisions are compared, the general result is found to reflect the composition of the population of these districts with respect to the relative frequency of the different racial and nativity groups, as shown in Table No. 8.

TABLE VIII.

TABLE V III. (cont.)

East North Central	9,392,792	8,857,829	106.0	8,177,308	7,808,273	104.7
West North Central	6,092,869	5,545,052	109.9	5,412,014	4,935,409	109.7
South Atlantic	6,134,600	6,060,295	101.2	5,222,595	5,220,885	100.0
East South Central	4,245,170	4,164,731	101.9	3,809,666	3,738,091	101.9
West South Central	4,544,485	4,240,049	107.2	3,372,256	3,160,034	106.7
Mountain	1,478,010	1,155,507	127.9	940,038	734,619	128.0
Pacific	2,365,878	1,826,426	129.5	1,357,694	1,058,998	128.2

Where the negroes are most numerous, as in the South Atlantic and East South Central States, the sexes are most nearly equal. Those States which owe a large part of their population to accretions from elsewhere, whether from foreign countries or from other parts of the United States, show the greatest preponderance of males. The New England division alone shows an excess of females; while this division has grown very largely through immigration, it has from the character of its industries drawn more female immigrants proportionately than other parts of the country. The New England States have, moreover, lost some of the natural excess of males through migration of persons born in New England to more western communities.

In the Middle Atlantic division the proportion of 103.3 males to 100 females is somewhat less than that for the United States as a whole. It would appear that the effects of foreign immigration are in part offset by the migration from these States of native-born citizens. The increasing division, however, of the stream of immigration in recent years to eastern communities instead of western communities is reflected in the fact that in each of the three northern divisions east of the Mississippi River the proportion of males is somewhat larger in 1910 than it was in 1900.

The East North Central division, where there are 106 males for every 100 females, corresponds to the general average of the United States; the proportion of males has increased during the decade.

Among the remaining sections of the country, the South Atlantic and East South Central divisions, which have, respectively, 101.2 and 101.9 males to every 100 females, fall below the average for the United States as a whole largely because of the influence of the negroes in the total; while the West North Central (109.9) and the West South Central (107.2) rise slightly above the general average for the United States. The most marked divergence from the general average is found in the Mountain and Pacific divisions, which have, respectively, 127.9 and 129.5 males for every 100 females. In all the southern divisions and those lying west of the Mississippi River there has been very little change in the proportions during the past 10 years.

EFFECTS OF MIGRATION. The effects of westward migration within the country itself are brought out more clearly by considering the sex proportions for the different elements of the population in the different geographical divisions, as shown in Table No. 9. Among the

TABLE IX.

Divisions	Males per 100 females				
	Native white native parents	Native white foreign parents	Foreign white	Negro	All other
United States	104.0	99.5	129.2	98.9	185.0
New England	98.1	96.0	104.8	97.7	403.5
Middle Atlantic	98.9	96.5	120.9	94.9	323.9
East North Central	102.9	98.7	131.2	108.3	147.5
West North Central	106.6	103.3	141.3	108.1	112.2
South Atlantic	102.1	97.6	146.9	97.5	135.1
East South Central	103.5	94.5	139.3	98.4	137.1
West South Central	108.2	105.1	138.9	100.4	105.5
Mountain	119.8	112.7	189.7	121.8	143.2
Pacific	117.4	106.8	181.9	120.6	395.4

native white of native parents there are in the country as a whole for every hundred females 104 males; but in New England, where the proportion is 98.1, and in the Middle Atlantic States, where it is 98.9, the females in this element of the population exceed the males. The East North Central division, with a proportion of 102.9, the South Atlantic, with one of 102.1, and the East South Central, with one of 103.5, fall below the average for the United States in respect to excess of males among the native whites of native parentage. On the other hand all of the sections west of the Mississippi River have a considerably larger proportion of males per hundred females among this class than the United States as a whole.

In the group "Native white of foreign parents" there is in the United States as a whole

practical equality, but east of the Mississippi River there are more females than males, while in all the sections west of the Mississippi River there are more males than females.

Among the foreign white there are in the United States as a whole 129.2 males for every 100 females; but the New England division, with 104.8, and the Middle Atlantic division, with 120.9, fall below this average. It is particularly in the regions west of the Mississippi River that a very high ratio of males is to be found among the foreign-born whites; in the Mountain and Pacific divisions there are very nearly two males of this class for every female.

The negro has 98.9 males to every 100 females, and the proportions are somewhat lower in the two southern divisions east of the Mississippi River, where the negro is at home. Other sec-

tions offer contrasts. In the New England and Middle Atlantic divisions, the proportion of negro males is less than the average, indicating, probably, a migration for agricultural and other heavy labor.

WHERE FEMALES OUTNUMBER MALES. Attention has been called to the fact that in the United States as a whole the males predominate. There are only six States, including the District of Columbia, in which at the present time females are in the majority, as follows:

TABLE X.

State	Males	Females
Massachusetts	1,655,226	1,711,190
Rhode Island	270,359	272,251
Maryland	644,225	651,121
District of Columbia	158,050	173,019
North Carolina	1,098,471	1,107,816
South Carolina	751,842	763,558

In these six States there is a net excess of 100,782 females, but in the country as a whole there is a net excess of 2,691,978 males.

The six States above named also showed an excess of females in 1900, and, in addition, there were five other States—New Hampshire, New York, New Jersey, Virginia, and Georgia—which then had an excess of females but which now have an excess of males. The net excess of females in 1900 in these 11 States was 181,740, but for continental United States as a whole the net excess of males in 1900 was 1,638,321.

NATIONALITY OF THE FOREIGN-BORN WHITE POPULATION OF THE UNITED STATES

The fourth of these bulletins relates to the nationality of the foreign-born population of the United States.

This statement covers only the principal countries of birth—those, in general, for each of which at the census of 1910 upwards of 100,000 persons were reported—and the figures for 1910 are given in round numbers, being subject to possible revision as the result of later tabulations. The statistics relate to white persons only.

Table No. 11 gives comparative figures for each principal country of birth as shown by the censuses of 1910 and 1900, and also in each case the numerical increase during the decade.

TABLE XI.

Country	1910	1900	Increase 1
Total foreign-born white	13,342,500	10,213,817	3,128,683
Austria-Hungary ..	1,658,700	636,968	1,021,732
Austria	1,190,200	491,259	698,941
Hungary	468,500	145,709	322,791
Germany	2,499,200	2,813,413	-314,213

Switzerland	124,800	115,581	9,219
All other	286,300	116,989	169,311
Canada and Newfoundland	1,198,000	1,172,745	25,255
Mexico	128,800	101,908	116,892
All other countries..	146,500	69,855	76,645

1 A minus sign (—) denotes decrease.

Table No. 12 shows the per cent. of increase during the decade 1900-1910 for each of the leading countries or groups of countries and also the per cent. of the total foreign-born white population for both 1910 and 1900 represented by each.

TABLE XII.

Country	Per cent. of total		Per cent. increase, 1900-1910
	1910	1900	
Total foreign-born white	100.0	100.0	30.6
Germany	18.7	27.5	-11.2
Ireland	10.1	15.8	-16.3
Great Britain	9.2	11.4	4.7
Canada and Newfoundland	9.0	11.5	2.2
Norway, Sweden, and Denmark	9.4	10.4	17.7
Austria-Hungary ..	12.4	8.3	160.4
Italy	10.1	4.7	177.3
Russia and Finland ..	12.8	6.8	166.4
Other Europe	5.6	4.4	66.5
Mexico	1.6	1.0	114.7
All other countries ..	1.1	0.7	109.7

IMMIGRATION FROM 1821 TO 1870. From 1821 to 1870 natives of Germany, Great Britain, Ireland, Scandinavia, and Canada together contributed substantially nine-tenths of all the immigrants to this country, but since 1870 their proportion of the total number has steadily declined—from somewhat more than four-fifths for 1871-1880 to three-fourths for 1881-1890, about two-fifths for 1891-1900, and only a little more than one-fifth for 1901-1910.

Immigrants from Austria-Hungary, Italy, and Russia, on the other hand, constituted less than 1 per cent. of all the immigrants from 1821 to 1870, but thereafter their proportion has steadily increased—from about one-sixteenth for 1871-1880 to one-sixth for 1881-1890, one-half for 1891-1900, and very nearly two-thirds for 1901-1910.

As the result of these changes in the sources of immigration to this country, and because of the very large number of immigrants during the decade 1901-1910, the relative distribution of the foreign-born white population at the last two federal censuses, and the increase or decrease of its constituent elements since 1900, is a matter of very considerable interest and importance.

RELATIVE DISTRIBUTION OF FOREIGN-BORN WHITES, 1901-1910. At the census of 1910, as shown by Tables 11 and 12, out of an approximate total for continental United States of 13,342,500 foreign-born whites, the persons born in Germany numbered 2,499,200 and constituted 18.7 per cent., as compared with 2,813,413 in 1900, or 27.5 per cent. of the total at that census. This is a loss of the number of natives of Germany during the decade of 314,213, or 11.2 per cent.

A similar condition is also apparent with respect to natives of Ireland. At the census of 1910 there were reported 1,351,400 persons born in Ireland, constituting 10.1 per cent. of the entire foreign-born white population, as compared with 1,615,232 persons so born, or 15.8 per cent. of the total, at the preceding census, a loss from 1900 to 1910 of 263,832, or 16.3 per cent.

During the decade 1900-1910 there was an increase in the number of natives of Great Britain from 1,166,863 to 1,221,400, or 4.7 per cent., although for natives of Wales alone there was a

decrease of very nearly 11,000; an increase in the number of natives of Canada and Newfoundland from 1,172,745 to 1,198,000, or 2.2 per cent.; and an increase in the number of natives of Norway, Sweden, and Denmark from 1,062,124 to 1,250,500, or 17.7 per cent. Natives of each of these groups of countries, as well as of Germany and Ireland, constituted a considerably less proportion of the total foreign-born white population in 1910 than in 1900. Natives of all of these countries taken together were 56.4 per cent. of the total in 1910, as against 76.8 per cent. in 1900.

THE NATIONALITIES INCREASING IN NUMBERS. Against the decline in the proportion for these countries stand very large gains shown (see Table No. 11 for natives of Austria-Hungary, Italy, and Russia and Finland, for each of which the proportion in 1910 is more than double that shown for the preceding census.

In 1900 there were in continental United States 636,968 natives of Austria-Hungary, constituting 6.2 per cent. of the total foreign-born whites, but in 1910 their number was 1,658,700, or 12.4 per cent. of the total.

Similarly, of natives of Italy there were 483,963, or 4.7 per cent., in 1900 and 1,341,800, or 10.1 per cent., in 1910; and of natives of Russia and Finland 640,710, or 6.3 per cent., in 1900 and 1,706,900, or 12.8 per cent., in 1910.

For persons born in each of these three countries an increase of more than 150 per cent. is shown for the decade 1900-1910; together they new constitute fully 35 per cent. of the total foreign-born white population of the country as against a little more than 17 per cent. 10 years ago.

There has been an increase during the decade of over 100 per cent. in the number of natives of Mexico in this country—from 101,908 in 1900 to 218,800 in 1910—but they are largely confined to the border States of Texas, California, and New Mexico.

POPULATIONS OF CITIES AND TOWNS. The populations of the principal cities and towns in the States in 1910 will be found in the paragraph *Population*, under the States.

FIFTY LEADING MANUFACTURING CITIES. The rank of the cities of the country with respect to manufactures is in many cases decidedly different from their rank in population. Thus Boston ranks fifth in population, but eighth in value of manufactured products; Baltimore, seventh in population, but thirteenth in value of manufactured products; Los Angeles, sixteenth in population, but thirty-second in value of products. Kansas City, Kan., on the other hand, by reason of the large slaughtering establishments there, ranks fifteenth in value of manufactured products, but is not among the fifty

1 A minus sign (—) denotes decrease.

principal cities from the standpoint of population. Of the fifty cities in the United States which have over 100,000 inhabitants, fourteen are not included among the fifty cities having the largest value of manufactures.

In the case of some cities tabulated on page 757 the rank with respect to the number of wage earners and the value added by manufacture is very different from that with respect to the gross value of products, these differences being dependent upon the character of the predominating industries. It is noteworthy, however, that the thirteen cities, New York, Chicago, Philadelphia, St. Louis, Cleveland, Detroit, Pittsburgh, Boston, Buffalo, Milwaukee, Newark, Cincinnati, and Baltimore, which rank highest in gross value of products are also the thirteen which occupy the highest rank with respect to wage earners and value added by manufacture, although considered individually these cities do not in all cases hold the same rank in each of the three respects. Conspicuous instances of cities having higher rank in gross value of products than in number of wage earners or value added by manufacture are Kansas City, Kan., South Omaha, Youngstown, Bayonne, and Perth Amboy. On the other hand, cities which lead in the manufacture of textiles, such as Lawrence, Fall River, Lowell, New Bedford, and Paterson, have a decidedly higher rank with respect to number of wage earners than with respect to either value of products or value added by manufacture.

The thirteen cities showing percentages of increase in the value of products, ranging over 100 per cent. between 1899 and 1909, arranged in ranking order, are: Perth Amboy, Los Angeles, Yonkers, Akron, Seattle, Detroit, Camden, Youngstown, Kansas City, Mo., New Bedford, Indianapolis, Buffalo, and Kansas City, Kan.

In percentage of increase in average number of wage earners, the cities which showed more than 50 per cent. between 1899 and 1909, arranged in ranking order, are: Los Angeles, Perth Amboy, Seattle, Camden, Detroit, Akron, New Bedford, Yonkers, Lynn, Bayonne, Syracuse, Cleveland, Waterbury, Omaha, Indianapolis, Bridgeport, Kansas City, Mo., and Buffalo.

UNITED STATES DEPARTMENT OF AGRICULTURE. The work done in the several divisions of the United States Department of Agriculture will be found in the various articles distributed throughout this book. For notes relating to the enforcement of the pure food and drug laws, see the article **FOOD AND NUTRITION**; for studies in soils and use of phosphates, see **SOILS AND FERTILIZERS**. Efforts to eradicate insect pests are described in the article **ENTOMOLOGY**. The results of the work of the Office of Experiment Stations will be found described in the articles **AGRICULTURAL EDUCATION**, **AGRICULTURE**, and **AGRICULTURAL EXPERIMENT STATIONS**. See also **ROADS AND PAVEMENTS**.

UNITED STATES STEEL CORPORATION. COMMISSIONER OF CORPORATIONS' REPORT. On July 1 Mr. Herbert Knox Smith, commissioner of corporations, submitted the first of three parts of a report on the history, organization, capitalization, and monopoly power of the steel corporation. He pointed out that this is a holding company owning, in most cases, all the stock of constituent companies; and that its formation was due to a threatening state of cutthroat competition in the steel industry in 1900-1901. The report analyzed the capitalization and property values of the corporation

at the time of its formation and at various times in its history. By different methods the commissioner computed the actual total value of the property of the corporation in 1901 at \$700,000,000; the amount of water in the capitalization at that time was placed at \$721,000,000. He declared the entire issue of about \$508,000,000 common stock and from one-fifth to two-fifths of the preferred stock were not represented by physical property. During the next ten years, however, he found that the corporation had invested \$505,000,000 in plants and other property, of which \$435,000,000 was from the profits of the corporation. He therefore computed the total actual value of the investment of the corporation on December 31, 1910, at \$1,187,000,000; so that by his figures the capitalization on that date exceeded the actual investment by \$281,000,000. The corporation's own estimate of the value of its holdings at that date was \$1,652,000,000. With reference to the capitalization the commissioner called attention to the claim of the corporation that the combination had increased the value of each of the constituent companies and that, therefore, a considerable increase in the amount of capital at the time of the formation of the trust was justifiable. He pointed out, however, that it is not justifiable, from the standpoint of public policy, to permit corporations to secure monopoly power by combination and then capitalize the increase earnings due to such power.

A considerable part of the difference in the commissioner's and corporation's estimates of the true value of the properties was due to the differences in valuation of the ore properties held by the corporation. The report valued these at only \$120,000,000, whereas the corporation itself valued them at \$641,000,000. It was in this control of ore supplies and the means of transporting them that the commissioner found the greatest elements of monopoly. Through the lease of the Great Northern ore fields and others the corporation had obtained control of 75 per cent. of the mines in the region of the Great Lakes with a total of more than 2,500,000,000 tons of iron ore. Mr. Smith held that this leasehold system which "lends itself to such marked concentration of ore property for many years in advance (a common term of leases being fifty years) at a comparatively small cost involves questions of the highest public importance." The corporation's ability to exercise monopoly power in the control of iron ore was greatly increased, according to the report, by the two ore railroads owned by the corporation in the iron mining districts. These roads operate for 30 per cent. of gross earnings, as compared with an average of 66 per cent. for American railroads, and yet it charges one cent. per ton mile for low-grade traffic as against two-fifths of a cent on other roads. This reduces the cost of ore to the corporation while increasing that cost to those competitors dependent on these roads for transportation. The report strongly criticises the commission paid the promoters of the combination at the time of its formation. Commissioner Smith found that in 1901 the syndicate pledged itself to produce \$25,000,000 working capital, that they expended \$3,000,000 more in starting the concern, and that it had a nominal liability of \$200,000,000, though "it was generally understood at the time that only \$25,000,000 would be called from syndicate members." For this service

1,300,000 shares of stocks was paid, on which about \$90,500,000 was realized, giving a profit of \$62,500,000.

As to the general control of the steel industry by the corporation the commissioner found that the proportion of business controlled by the corporation had more or less steadily diminished from the date of its formation. This verified the statement of Chairman Gary that the steel corporation had always conducted its affairs in a reasonable manner and that it had never sought more than 60 per cent. of the steel business of the country.

Although the commissioner found many things in the management of the corporation that were praiseworthy in relation both to the public and to its employees, nevertheless he harshly criticised the wages and hours of labor maintained by the corporation. His report here harmonized with other investigations, showing that the labor conditions in the steel industry were a disgrace to the nation.

As to the earnings of the steel trust the report states, on the basis of a careful analysis and revision of the corporation's own figures of investments and earnings, that the average for the ten years was 12 per cent., ranging from 7.6 per cent. to 15.9 per cent. The aggregate net earning in that period were \$1,100,000,000.

Shortly after the publication of this report the management of the steel corporation announced that they would cancel their leases of the Great Northern ore fields by giving the necessary two years' notice; and that they would reduce the rates of transportation on their ore roads from eighty cents to sixty cents per ton. This announcement was made on the same day, but a few hours before suit for the dissolution of the corporation was begun at Trenton, N. J.

STANLEY COMMITTEE INQUIRY. On May 16 the House of Representatives passed a resolution providing for the appointment of a committee to investigate the activities of the steel corporation and its subsidiary companies. Representative Stanley of Kentucky was made chairman. Other members were Bartlett of Georgia, Beall of Texas, Littleton of New York, and McGillicuddy of Maine, Democrats; Olmsted of Pennsylvania, Young of Michigan, Sterling of Illinois, and Danforth of New York, Republicans. This committee was authorized to ascertain whether the steel company or any of its officers or agents "have caused or have a tendency to cause restriction of competition." It was to investigate the whole question of competition, capitalization, and the official conduct of the corporation's officers. It held hearings at Washington in August.

One of the most interesting witnesses before that committee was President Roosevelt, who was questioned as to the purchase of the Tennessee Coal and Iron Company during the panic of 1907. He vigorously defended his action in saying that at that time he saw no reason for prosecution. He assumed entire responsibility for what was done. He claimed that the action checked the panic and was, therefore, beneficial; and that the opposite course would have been "well-nigh criminal." He pointed out that Judge Gary and Mr. Frick told him at that time that the policy of the corporation was to limit its proportion of the steel business to 60 per cent.; that it was at that time appreciably below that figure and that the purchase of the Southern company would not increase its share of the steel business to more than 62

per cent. On this ground the ex-President thought that, disregarding the motives of the corporation in acquiring its Southern rival, its legal status was not affected by that purchase.

A surprising witness was Judge Gary, chairman of the executive committee of the corporation. He similarly defended the action of his company in taking over the Tennessee Coal and Iron Company in 1907. He would not admit that his company fixed the prices of steel products. He denied that the so-called Gary dinners, where representatives of different steel companies met representatives of the trust, resulted in any tacit agreement to maintain uniform prices. On the subject of federal control Judge Gary took an extreme position. He declared himself in favor of a governmental bureau to which he could explain the condition of business and ask what methods and prices were allowable.

Part of Chairman Gary's testimony was contradicted by the testimony of A. L. Lukens, president of an independent company, who said that at the aforesaid dinners Judge Gary had read lists of prices which his corporation was to maintain, the other companies tacitly agreeing to accept them. Other testimony seemed to show that the corporation allowed a rebate of three dollars per ton to the International Harvester Company. It was said that this fact had been disclosed to former Attorney-General Bonaparte in 1908 in a special report on this company. There was in addition to the above much evidence presented tending to show that the bankers and brokers carrying the stock of the Tennessee Coal and Iron Company in 1908, being in danger of failure, appealed to the capitalists interested in the corporation for relief through the purchase of that stock. The chairman of the committee introduced a copy of a combination agreement fixing the prices and dividing the sales of steel plates. This agreement was signed by eleven companies who maintained such a pool from 1900 to 1903.

INTERNATIONAL STEEL ASSOCIATION. This association was formed in Brussels in July. It was the direct result of a proposal made by Judge Gary at a dinner given to European ironmasters attending the American Iron and Steel Institute. The object of this international association is to extend friendly relation among steel producers of the world with a view to steadying prices. It was declared by some students of industrial conditions that Judge Gary's real object in bringing about such an international understanding was to ward off any severe competition in this country which might result from the removal of the import duties on steel products.

FEDERAL SUIT. On October 26, 1911, the government began suit in the United States Circuit Court at Trenton, N. J., for the dissolution of the steel corporation, its constituents, and all subsidiaries, as a combination in restraint of trade. Not only the steel corporation and its 17 leading constituent companies and 20 subsidiaries, but also 18 individuals, including Morgan, Rockefeller, Carnegie, Gary, Perkins, Schwab, and Frick, were included in the indictment. The government's petition stated in detail the official view of the acquisition of the Tennessee Coal and Iron Company, during the panic of 1907. The petition declared that ex-President Roosevelt was misled at that time; that he had no opportunity of knowing that the desire to stop the panic was in all probability

subordinate to the desire to increase the control of the steel business. The dinners given by Judge Gary to representatives of different steel companies were also cited as evidence of collusion to maintain prices. The petition also laid stress upon the interlacing system of directorates, believing those in the control of the steel industry also controlled great banking and railway interests. This suit differs radically from those against the Tobacco and Oil combinations, since no charges of unfair business methods are made. Moreover, the court's decisions in those cases definitely established the principle that mere size is no ground for prosecution. The real issue thus hinged on the question whether the alleged stock-jobbing methods by which the Tennessee Company was acquired and oral agreements as to prices constituted violations to the Sherman act. Following the initiation of this suit, Judge Gary published a statement on October 27 in which he declared that the corporation had been fair in its business methods and that the suit would establish the following points: That in the organization of the corporation there was no intention of forming a monopoly or restraining trade; that no monopoly or restraint had yet been attempted; that the existence of the corporation had been of benefit to its employees, its customers, its competitors, and the general public; and that no misrepresentation was made to Mr. Roosevelt relative to the purchase of the Tennessee properties, the motive of that purchase being to prevent a threatened general financial disaster.

LABOR CONDITIONS IN THE CORPORATION'S PLANTS. *The Cabot Episode.* In 1910 a movement was begun by Mr. Charles M. Cabot of Boston to secure an investigation of labor conditions in the plants of the corporation. His demand was based on the results of the Pittsburgh Survey. Mr. John A. Fitch, who wrote up those results in part in the *Steel Workers* (N. Y., 1910), summarized labor conditions thus: "A daily and weekly schedule of hours both shockingly long; a system of speeding up, which adds overstrain to overtime; and, crowning all, a system of repression that stifles initiative and destroys healthful citizenship." Mr. Cabot thought the corporations had gone too far in stamping out every vestige of organization among the workers. He desired an inquiry into wages, hours per day and per week, rate-making, unionism, the spy system, and all other elements entering into the relations between the company and its workers. Mr. Gary declared that the corporation welcomed criticism and profited by it. He, therefore, permitted an investigation by a stockholders' committee to be authorized in April. Meanwhile, Mr. Cabot sought to get a mailing list of at least 15,000 stockholders, to whom he wished to send copies of an article by Mr. Fitch in the *American Magazine* for March. This article was not deemed fair by the officers of the corporation, and Mr. Cabot thought the corporations had gone too far a writ of mandamus from a New York Supreme Court justice compelling the corporation to permit him to transcribe a mailing list. From this the corporation appealed, and final decision was not expected before May, 1912.

Welfare Work. At a meeting in July of the American Iron and Steel Institute, one of the avowed principles of which is to enable members "to coöperate along certain lines of welfare work," a tentative plan for the elimina-

tion of the seven-day week was presented. A committee on welfare work was appointed. It at once employed Dr. Thomas Darlington, for six years health commissioner of New York City, as the principal director of such work. The committee, with the apparently sincere support of the managers of various steel companies, plans to better housing conditions, sanitation, education, relaxation, amusements, and health for its employees. The trust has been one of the foremost corporations in the country in the introduction of safety devices, voluntary workmen's compensation, and a pension system for aged employees. In December, 1911, it distributed \$1,450,000 in bonuses for meritorious service to employees.

REPORT OF THE SECRETARY OF COMMERCE AND LABOR. On August 1 the secretary of commerce and labor transmitted to the Senate the first volume of a report on *Conditions of Employment in the Iron and Steel Industries in the United States*, entitled *Wages and Hours of Labor*. This was the result of an inquiry made under a Senate resolution of June 24, 1910. The report covered 344 plants, or practically all in the country. Not all workers, however, were included, but only those connected with fundamental productive operations, or 90,564 employees. Though not applying to the United States Steel Corporation in particular, the data are fairly typical of its conditions. The report showed that 49.7 per cent. of these men worked 72 hours per week; that 31.2 per cent. worked more than 72 hours per week; and that 24.6 per cent. worked 84 hours per week; or 12 hours per day for seven days. It stated that 90 per cent. of the 25,000 men in the blast furnaces worked seven days a week. About three-fourths of the men worked more than 60 hours a week; 10.8 per cent. worked just 60 hours per week; leaving only 15.8 per cent. who worked fewer than 60 hours. It pointed out that in thousands of cases the workers spend three-fourths of their waking hours in the mill, a condition of greatest significance for them and their families. It showed, moreover, that the tendency elsewhere is for a reduction of hours; that the ten-hour day has become general, and that in many cases the eight-hour day is established. It is a striking contrast, therefore, that in the basic industry of the country about one-half of the employees work 72 hours or more a week. The report condemned these long days and long weeks as unnecessary, and as being maintained for commercial reasons only. It especially condemned the system whereby in changing from the night to the day shift men work 24 hours continuously in many cases, and 18 hours continuously in others. It showed that in the blast furnaces, where for metallurgical reasons the plants must be run continuously, a distribution of working hours may easily be instituted whereby every man can have one day's rest out of seven. It declared, also, that much unnecessary Sunday work could be cut out without any appreciable loss or inconvenience. In this connection it mentioned the fact that the American Iron and Steel Institute had formulated such a plan and was at that time trying it in a few plants.

With reference to wages, the report first laid great stress on the large numbers of recent immigrants employed. It found that in all occupations in the industry nearly 60 per cent. of the employees are foreign-born, and nearly

two-thirds of the foreign-born are of the Slavic races. About one-half of the employees investigated were unskilled workmen; and in the blast furnace department more than two-thirds were unskilled, a considerable majority being unable to speak or understand English. Moreover, the investigation showed that there is a tendency toward the steady reduction in the number of highly skilled men employed. The wages were distributed as follows: 9.36 per cent. of the men earned less than 14c per hour; 12.01 per cent. earned 14c, but under 16c; 28.18 per cent. earned 16c, but under 18c; 25.36 per cent. earned 18c, but under 25c per hour; and 25.07 earned 25c or over. Those earning 50c and over per hour numbered 3915, or 4.32 per cent. of all. Those earning less than 18c per hour were classed as unskilled; those earning 18c, but under 25c per hour as semi-skilled; and those earning 25c and over as skilled workers.

UNIVERSALISTS. A Protestant religious denomination, first established in the United States at Gloucester, Mass., in 1799. Its most distinctive tenet is the final salvation of all men. According to the official statistics of the denomination there were in 1911 about 55,000 communicants, 904 parishes, and 689 ministers. The Sunday schools had a membership in that

year of about 50,000. The value of the church property was \$11,384,395. The permanent funds of the general convention amounted to \$401,800. The denomination carries on foreign missions in Japan and Cuba and sustains domestic missions in 15 States. Its educational institutions include Tufts College at Medford, Mass., St. Lawrence University at Canton, N. Y., Buchtel College at Akron, O., and Lombard College at Galesburg, Ill. It has also among its educational foundations Dean Academy at Franklin, Mass., Goddard Academy at Barre, Vt., and Westbrook Seminary, near Portland, Me. The next session of the general convention of the denomination will be held in Chicago, Ill., in October, 1913.

UNIVERSITIES AND COLLEGES. ATTENDANCE. Almost all of the educational institutions of the country report a largely increased attendance, although the gain in numbers is not generally so great as in 1909 and 1910. The registration at the leading universities of the United States for November 1, 1911, and in preceding years, as reported by Prof. Rudolph Tombo, Jr., of Columbia (*Science*, January 5, 1912) is given in the accompanying table:

	Total attendance Nov. 1, 1911	Attend. summer session, 1911	Grand total	Deduct sum- mer stu- dents *	Net total, Nov. 1, 1911	Total, Nov. 1, 1910	Total, Nov. 1, 1908	Total, Nov. 1, 1903

* Summer session students who returned in the autumn.

The apparent decrease in the case of Minnesota and Nebraska is due to a change in classification. The fall enrollment at some of the prominent colleges for men and for women and schools of technology is given below:

	1911	1910	1904
Amherst	464	502	412
Brown	933	930	988
Bryn Mawr	440	409	441
Dartmouth	1,385	1,229	926
Haverford	164	150	146
Lehigh	599	616	609
Mass. Inst. of Technology	1,610	1,506	1,561
Mount Holyoke	771	743	674
Purdue	1,762	1,611	1,359
Smith	1,508	1,618	1,067
Wellesley	1,433	1,378	1,050
Wesleyan	395	365	305
Williams	533	541	443

The aggregate enrollment of students in the 602 universities, colleges, and technical schools

reporting to the United States Commissioner of Education for the year ending June, 1910, was 301,818, including all departments, preparatory, collegiate, graduate, and professional. States or municipalities control 89 of these institutions, and 513 are controlled by private corporations. The 89 public institutions had an enrollment of 64,216 students in their collegiate departments, and 3410 in their graduate departments, making a total of 67,626, of whom 49,919 were men and 17,707 were women. The 513 private institutions enrolled 65,582 men and 44,415 women in their collegiate departments and 5081 men and 2008 women in their graduate departments, making a total of 117,086. Of the 602 institutions of higher education 142 are for men only, 108 for women only, and 352 for both sexes. The 108 colleges for women employed 2612 teachers, 648 men, and 1964 women. The remaining 494 institutions employed 24,667 teachers for all de-

partments, 21,813 men and 2854 women. The collegiate students of the 494 colleges, universities, and technical schools for both sexes and for men only numbered 153,866, distributed by departments, so far as reported, as follows: 44,849 students in the classical course, 11,163 in general science, 7372 in agriculture, 30,337 in engineering, 6963 in education, 4321 in commercial departments, 1934 in household economy, 8217 in music, and 2182 in art. The total number of degrees conferred in 1910 by the 602 universities, colleges, and technical schools reporting was, excluding honorary degrees, 17,187 on men and 8022 on women. The numbers receiving the more important degrees are as follows: Bachelor of arts, 7043 men, 5557 women; bachelor of science, 5014 men, 779 women; bachelor of philosophy, 841 men, 524 women; bachelor of letters, 428 men, 452 women; bachelor of mechanical engineering, 21 men; bachelor of electrical engineering, 23 men; bachelor of engineering, 104 men; bachelor of architecture, 30 men, 2 women; bachelor of scientific agriculture, 147 men, 3 women; bachelor of music, 8 men, 52 women; bachelor of pedagogy, 39 men, 39 women; master of arts, 1172 men, 465 women; master of letters, 278 men, 39 women; mechanical engineer, 502 men; civil engineer, 586 men; electrical engineer, 235 men; engineer of mines, 208 men; doctor of philosophy, 362 men, 44 women; doctor of business administration, 8 men.

Comparative statistics of the professional schools of the United States for each decade since 1870 are given in the accompanying table:

	1910	1900	1890	1880	1870
Theology:					
Schools	184	154	145	142	80
Students	11,012	8,009	7,013	5,242	3,254

Of the 11,012 students in theology 491 are women, and of the 19,567 law students 205 are women.

RESOURCES. The 494 universities, colleges, and technological schools, exclusive of colleges for women only, reported for 1910 productive funds aggregating \$259,376,878; scientific apparatus, machinery, and furniture, valued at \$32,747,424; livestock, \$780,246; buildings, \$211,440,008; grounds, \$67,688,727; libraries of 11,059,180 volumes, valued at \$19,246,218. The receipts for the year 1909-10 aggregated \$80,

438,987, chiefly from the following sources: \$14,687,192 from fees, \$11,592,113 from productive funds, \$19,720,899 from State or city, \$4,607,298 from the United States government, \$18,737,145 from private benefactions. The 16 leading colleges for women only reported endowment funds amounting to \$12,888,307; receipts for the year, \$4,845,615; libraries of 394,465 volumes, valued at \$780,838. The 92 other colleges for women only reported endowment funds amounting to \$1,158,143; receipts for the year, \$3,085,132; libraries, 286,526 volumes, \$313,229.

BENEFACTIONS AND APPROPRIATIONS. The financial statistics for 1911 are not yet published by the United States Bureau of Education, but judging from the reports we have received, the aggregate will be greater than last year. The legislatures, with a few exceptions, such as Kansas, have been unusually generous in the support of the State universities and the alumni of endowed institutions, large and small, have been active in raising funds. We can only mention here a few instances, which, for some reasons, are especially noteworthy. The Illinois legislature broke all records by passing a bill appropriating the sum of \$3,519,300 for the biennium, beginning July 1, 1911. The most interesting items in this bill are: Maintenance of the College of Agriculture and Agricultural Experiment Station, \$799,300; maintenance of College of Engineering and Engineering Experiment Station, \$180,000; Graduate School, \$100,000; social and political sciences, \$50,000; ceramics, \$30,000; books for library, \$50,000. With the funds received from the United States government for agricultural education and research and the fees from students, the income of the University of Illinois for the next two years will be about \$2,000,000 per annum. After that the University of Illinois will, by action of the same legislature, receive as its permanent support, a one mill tax, which is calculated to yield about \$2,250,000 a year, the equivalent of an endowment of \$45,000,000, at 5 per cent. The University of Michigan has a three-eighths mill tax, which, as a result of the increase in the valuation of property in the State, will yield an annual income of \$858,000, instead of \$650,000, as formerly. The legislature of Massachusetts has passed a bill appropriating \$100,000 a year for ten years to the Massachusetts Institute of Technology for running expenses, the institute giving in return 80 scholarships. The institute will also receive \$500,000 from T. Coleman du Pont, '84, for buying land on the new site, about the same from the bequest of Mrs. Emma Rogers, widow of William Barton Rogers, founder of the institute, and \$600,000 from the Francis B. Greene fund. Bryn Mawr received a bequest of \$750,000 from Miss Emma Carola Woerishoeffer, '07; and \$150,000 for a school of education, with a practice school. The gifts to Columbia University during the year aggregate nearly \$3,000,000. During the ten years of President Butler's administration Columbia has received gifts amounting to \$16,551,568.74. Western Reserve has completed the million-dollar special endowment for the medical school. To this fund John D. Rockefeller and H. M. Hanna each contributed \$250,000. De Pauw University has raised \$440,000 for endowment to meet the conditional gift of \$100,000 from the general education board. Oberlin College has raised a half-million-dollar fund with the aid of \$125,000 from the general

education board. Half of the fund will be spent for buildings and the other half will be put into endowment. The total assets of Oberlin have been raised in ten years from less than two million to more than four. Brown University is raising a million-dollar fund, of which over half has been subscribed, including \$150,000 from the general education board. Harvard has received during the year \$1,300,000 from various donors. Ohio Wesleyan has additional endowment pledged to the amount of half a million. Vanderbilt has received \$150,000 from the general education board for endowment and the same sum from W. K. Vanderbilt for the medical department. The Oregon legislature authorized a special appropriation of \$500,000 to the State University for new buildings and equipment, but the appropriation was held up by referendum petitions. The university has brought suit to declare the petitions void on account of wholesale frauds and forgeries in the signatures. Boston University has increased the general endowment by \$400,000, and made a \$250,000 addition to the hospital facilities of the medical school. Dartmouth College reports the Edward Tuck gift of \$400,000 to raise the salaries of the faculty. De Pauw has raised an endowment of \$400,000, of which one-quarter comes from the general education board. Johns Hopkins University has raised \$750,000 to meet the conditional gift of \$250,000 from the general education board. The University of California received from Mrs. Jane K. Sather \$200,000 for a campaign, \$23,000 for chimes, and \$200,000 for the endowment of chairs of history and classics. Vassar College received from Mrs. Russell Sage \$225,000 for the erection of the Olivia Josselyn hall of residence. Morton F. Plant, of New London, Conn., has offered a million dollars to found at that place the Connecticut College for Women.

CARNEGIE FOUNDATION. The Carnegie Foundation for the Advancement of Teaching paid out during the fiscal year 1909-10 to the 71 accepted institutions for retiring allowances and pensions, \$325,199.02, and to individuals in institutions not on the accepted list \$144,635.28. Four additional institutions were admitted to the privileges of the Foundation: The University of California, Indiana University, and Purdue University as component parts of a single State University, and Wesleyan University.

DOCTOR'S DEGREES. The extent of the graduate work being done in different universities and in different fields of research may be measured by the number of doctorates conferred since this degree is fairly well standardized, although the requirements for it are by no means equivalent, even in the same institution. It is now rarely used as an honorary degree, and the smaller universities generally refrain from giving it except where the opportunities of research in some department are such as to justify it. The accompanying table, published in *Science*, August 18, 1911, summarizes the doctorates of the past 14 years:

	Average					Total

To these should be added about 50 Americans, who annually receive the degree of doctor of philosophy or its equivalent abroad. It is estimated that about three-fourths of those who receive the doctor's degree in science continue afterwards to do scientific work. The following table, giving the number of doctorates conferred in the various departments of graduate work, show the rapid increase in the natural and exact sciences, especially chemistry, which has twice the number of any other subject. The popularity of chemistry is due in part to the fact that it offers a double opportunity for employment, in industrial as well as educational work.

NEW PRESIDENTS. The following institutions elected or inaugurated new presidents during the year 1911: New York University, Elmer Ellsworth Brown, United States Commissioner of Education since 1906, succeeding Chancellor MacCracken. University of Minnesota, George Edgar Vincent, of the University of Chicago, succeeding Cyrus Northrop. University of Vermont, Guy Potter Benton, president of Miami University, succeeding Matthew H. Buckham. Iowa State University, John Gabbert Bowman, secretary of the Carnegie Foundation, succeeding George E. Maclean. University of West Virginia, Thomas Edward Hodges, professor of physics at West Virginia, succeeding Daniel Boardman Purinton. Boston University, Lemuel Herbert Murlin, president of Baker University, Kansas. Wellesley College, Miss Ellen Fitz Pendleton, dean of the college. University of Arizona, Arthur H. Wilde, professor of history in Northwestern University. Wilson College, Miss Anna J. McKeag, head of the educational department of Wellesley. Dickinson College, Eugene Allen Noble, president of Goucher College, succeeding George E. Reed. William Trufant Foster, professor of education at Bowdoin, has been selected as the first president of Reed College, established at Portland, Ore., on the endowment of \$3,000,000 bequeathed by the late Mrs. Amanda Reed. No successor has yet been selected for President George Harris, of Amherst, who resigned at the age of 68, after 13 years' service in the presidency.

NEW BUILDINGS. The graduate college of Princeton University, as planned by Dean Andrew F. West, is now in course of construction, and it is expected to be completed by the spring of 1913. The group consists of the Cleveland Memorial Tower; Procter Hall, containing the large dining hall; Thompson College, the quadrangle, with suites of rooms for 81 students; South Tower, and Wyman House, the residence of the dean. Cornell is spending more than a million dollars on new buildings, among them one for the department of domestic science, costing \$154,000, and containing a lunch room, where over a thousand persons may be served; an auditorium costing \$138,000; a veterinary hospital, costing \$140,000; a building for poultry husbandry, costing \$90,000; and Prudence Risley Hall for women, for which Mrs. Russell Sage has donated \$300,000. Yale is carrying out the largest building programme of any year in its history, except, perhaps, the bi-centennial year, involving the expenditure of about \$1,500,000 in land and construction, and comprising

laboratories, dormitories, and the Day Memorial Library of the Divinity School. Columbia has under construction a building for the architectural school and Avery library. Plans for the Germanic Museum of Harvard have been prepared by Professor Bestelmeyer of Dresden. Adolphus Busch of St. Louis has contributed \$250,000 toward its construction. The Harvard Medical School is attracting to the Fenway region a remarkable group of allied institutions for the study and treatment of disease. Besides the five stately buildings forming the original group, there are either completed or under construction the Harvard Dental School and Infirmary, the Huntington Memorial Hospital for cancer patients, the Infants' Hospital, the Children's Hospital, the Peter Bent Bingham Hospital, with 14 buildings, the House of the Good Samaritan for women suffering from chronic diseases, the Carnegie Nutrition Laboratory, the Psychopathic Hospital, and several others. Altogether, the buildings will represent a cost of between seven and eight millions. Harvard University is planning for a new library to replace Gore Hall, and shelve 2,400,000 volumes, at a cost of two million dollars. The Harper Memorial Library, which constitutes the central structure of the Midway Plaisance façade of the University of Chicago, is now approaching completion. Nine new buildings are being erected at the University of Wisconsin, among them a women's dormitory, a model high school, and buildings for home economics and extension work, for agricultural chemistry, and for biology, the whole to cost nearly a million dollars. The University of Pennsylvania has dedicated a large zoölogical laboratory, containing 97 rooms, admirably arranged for experimental research, with salt and fresh water aquaria and breeding-rooms insulated for maintaining any desired temperature. The University of Texas has completed a library at a cost of \$250,000. The style of architecture, Spanish renaissance, will be followed in future buildings on the Texas campus. At Brown University the John Hay library, costing \$300,000, has been dedicated. The University of Illinois named after Lincoln its new building for modern languages and political science, costing \$250,000. The University of Iowa has erected a hall of physics at a cost of \$225,000. With a bequest of \$230,000 from the late regent, Arthur Hill, the University of Michigan will erect an auditorium seating 5000. The Catholic University of America has laid the cornerstone of the Gibbons Memorial Hall, a residence for 130 lay students, to cost \$250,000. The University of California has added two new buildings to the permanent architectural group; the library made possible through the bequest of Charles Franklin Doe of \$664,000, and the Boalt Hall of Law, for which Mrs. Elizabeth H. Boalt contributed \$100,000, and the bench and bar of California \$50,000. Ohio State University has under construction a library costing \$250,000, and a building for the State Archæological and Historical Association, costing \$100,000. The new Ohio Union, a clubhouse for students, costing \$100,000, is now in use.

ENTRANCE REQUIREMENTS. The question of the best method of admission to college has long been the subject of earnest discussion and this year some of the leading universities have made important changes in policy on this point. The certificate system which places the responsibility for determining the fitness of the candidate for

FOUR UNIVERSITY OR COLLEGE PRESIDENTS

college work primarily upon the school that prepared him for it, was introduced by the University of Michigan 40 years ago and was gradually adopted throughout the West by private as well as State institutions, and now prevails in some degree almost everywhere. Four of the most important universities have hitherto stood out against the certificate system and insisted upon examinations for entrance: Harvard, Columbia, Yale, and Princeton. In June, 1911, Harvard put into effect a new alternative plan which reduces the number of examinations to four and takes into consideration the school record, as well as the results of these examinations. The candidate for admission to Harvard under this plan must present an official detailed statement showing that he has pursued in a satisfactory way an approved course of four years, concerned chiefly with languages, science, mathematics, and history, no one of which has been omitted and two of which must have been pursued beyond their elementary stages. He must also pass examinations in four subjects as follows: (1) English; (2) Latin, or for S. B., French or German; (3), mathematics, or physics, or chemistry, and (4) any subject of the following, not already selected: Greek, French, German, history, mathematics, physics, chemistry.

The four examinations must be taken at one time, either in June or September. The examinations will be adapted to various methods of teaching and contain questions sufficient in number and character to permit each student to reveal the full amount and quality of his attainment. The school record will always be considered in connection with the examinations, and the candidate will be either admitted without conditions or rejected. One object of the new scheme was to free Harvard from dependence upon private fitting schools, by enabling the graduates of the public high schools, especially in the West, to enter the university. That it is going to accomplish this object and does not involve a lowering of standards, was shown by the results of the first examinations. Of 206 applicants for admission under the new plan, 66 were refused admission upon their school record. Of those allowed to try, 57 were rejected and 83 admitted. In other words, a larger number of candidates was refused admission than under the old plan. Under the old plan 84.9 per cent. of the candidates came from the New England States, 8.5 per cent. from other Atlantic States, and but 4.5 per cent. from the Western States. Under the new plan 47 per cent. came from New England, 41.5 from other Atlantic States, and 21.5 per cent. from west of the Alleghenies. Under the old plan about 54 per cent. of Harvard's students came from private fitting schools, 45 per cent. from public high schools. Under the new plan 83.5 per cent. came from public high schools, and 15.5 per cent. from the private schools. This means a gain in quality because the public schools are turning out better men than the private schools, as is shown by the award of scholarships in Harvard College for 1911-12. Of the scholarships given to students because of the excellence of their work in the last academic year, 117 went to men from the public schools and 39 to those from private schools, that is, the public school men, though fewer than the private school men, obtained three times the honors.

This modification of the Harvard entrance requirements is regarded by the Yale authorities

as a dangerous plan and a step in the direction of the general certificate system. Some of the Western alumni of that university have urged concessions to the certificate system, but without success. The Sheffield Scientific School of Yale has dropped Latin from its requirements and reduced the number of required units in modern languages, history, and science. Columbia has appointed an official to examine the school records and personal qualifications of candidates, so that the question of their fitness for admission shall not depend entirely upon their examination papers. The trustees of Princeton have appointed a committee to consider modifications of its entrance examination system.

The new Harvard plan, although it specifies only four subjects, does not satisfy the demand of the high school for complete control of its curriculum, for to meet the requirements of the university about seven-eighths of the student's work is still prescribed, and the new technical high schools, now being established in many places, could not send their graduates to Harvard. The University of Chicago has gone further than any other of the great universities in concessions to high school autonomy by the admission plan adopted this year. Chicago requires three units of English; three units from some one group of subjects—languages, or mathematics, or history, or science; two units from another of these groups; two units of any combination within the four groups—as, for example, one of history, and one of science. The other five units are elective—what the school offers the university will take, and take without examination. No students will be admitted on conditions. Whether a high school remains upon the accredited list will depend chiefly upon the record of its graduates in the university. The relation between high school and university is made reciprocal. A report of the student's work is sent back to the high school and the principal and teachers are invited to inspect and criticise those university classes which continue high school subjects.

CHANGES IN ORGANIZATION. The universities and colleges of the United States have come in for much sharp criticism in recent years on the ground that they were not making the best possible use of the vast funds now being placed at their disposal. The Carnegie Foundation for the Advancement of Teaching in its bulletin, No. 5, issued in 1910, compared "Academic and Industrial Efficiency," much to the disadvantage of the former, and urged the adoption of modern business methods in the administration of university affairs. This outside criticism has been generally resented by university authorities, who hold that to treat an educational institution like a shop or factory would be to destroy, rather than to improve, its real "efficiency." Nevertheless, it is recognized that in many cases the simple and informal modes of procedure of earlier days have been allowed to remain long after they have become inadequate to the great universities of the present time. Several institutions have started a systematic overhauling of their machinery with a view of discovering "lost motion" and "waste of material." A special committee of Oberlin College has for three years been studying the problem and has prepared an elaborate scheme for testing college efficiency in all departments and phases of its work and influence. The recom-

mendations of the committee have already effected improvements in the standards of work and the forms of administration. The University of Illinois is engaged in drafting a constitution or charter for a State university, to settle such questions as centralization of authority, college autonomy, the source of power, origin of legislation, and individual freedom.

The colleges of Virginia are to be standardized according to the accepted definitions by the State Board of Education and inspected once a year. The Cornell College of Agriculture has been placed under the immediate supervision of a special committee of eleven persons known as the Agricultural College Council, instead of the executive committee of the board of trustees as formerly. Trinity College has appointed a joint committee composed of representatives of trustees, faculty, and public to consider the "larger questions of university administration." Ohio State universities and the University of Michigan have reorganized and enlarged their graduate schools.

To provide for the vocational courses that have developed in Teachers College of Columbia University a school of practical arts has been organized under a faculty distinct from the educational faculty of Teachers College. The subjects of instruction will include household and institutional management, dietetics and cookery, costume design and decoration, nursing and sanitation, wood and metal working, art industries and music. The purpose of this new school will be to give vocational training of collegiate grade and character to those students, both men and women, who do not wish to take a regular college course or to prepare themselves for one of the professions for which a college education is necessary.

NEW DEPARTMENTS. It would be impossible to mention here the numerous schools, departments, and chairs that are being added to meet the educational demands of our complex modern life, but a few items will serve to show the principal lines of development. The University of Michigan has created departments of fine arts and of engineering mechanics and has undertaken extension work on a large scale, providing a list of 300 lectures for the people of Michigan. Harvard and Michigan have established the degree of doctor of public health. The degree of associate in arts is to be given by Harvard University to students who have taken work in the summer school, extension courses and Radcliffe College equivalent in number to those required for the degree of A. B. Neither an entrance examination nor residence at the university is required for the degree of A. A. Northwestern University has received \$250,000 for research in the medical school. A pathological institute for the investigation of disease has been founded at the University of California by an anonymous gift of \$500,000. The University of Colorado has established a school of pharmacy. The University of Tennessee has moved its medical and dental departments from Knoxville to Memphis, and will add a school of pharmacy there. Washington University, St. Louis, has reorganized its medical school with full-time professors and has affiliated Barnes Hospital and the St. Louis Children's Hospital. The University of Washington, Seattle, has obtained \$30,000 for a bureau of child welfare. Bryn Mawr is to have an experimental high school

in connection with its graduate school of education. Jacob H. Schiff has given \$100,000 to Cornell for the promotion of studies in German culture. The New York legislature has established a State college of forestry at Syracuse University and appropriated \$55,000 for it. The legislature a few years ago refused State support to the Cornell College of Forestry, but work in that field has been reopened by the establishment of a department of forestry in the State College of Agriculture of Cornell University. Governor Dix vetoed a bill appropriating \$10,000 for establishing a State school of sanitary science and public health at Cornell. The Western States are beginning to recognize scholarly research in other than practical lines as a legitimate function of a university. The legislature of Illinois, as already mentioned, makes specific provision for this, and in 1911 the Minnesota legislature appropriated \$5000 a year to be devoted exclusively to research not agricultural.

The University of Missouri has added chairs of preventive medicine, forestry, and poultry husbandry. The Missouri course in forestry includes ten weeks in the Ozark Mountains between the junior and senior year. The University of North Dakota has introduced courses in ceramics and nursing. Oberlin has a new chair of comparative religion. The University of Michigan has arranged a system of coöperation in astronomical research with the University of La Plata, Argentina, according to which Prof. W. J. Hussey becomes director of both observatories and will divide his time between the two institutions. Columbia has introduced graduate courses in highway engineering. Patrick F. McGowan, ex-president of the board of aldermen of New York, has provided funds for the support at Columbia of a laboratory of politics which includes a museum of election ballots. The University of Chicago has formed a travel class to study the "background and environment, physical and human, of modern English literature," under the direction of Prof. W. D. MacClintock in important literary districts of England and Scotland during the winter. Similar classes in "field work" have visited Greece, Rome, and Palestine. The universities are being called upon more often than formerly to investigate problems of manufacture and commerce and of State and municipal administration. The Edison Company of Boston has provided \$3000 for the comparative study of electric, gasoline, and horse trucking at the Massachusetts Institute of Technology. Prof. Robert Kennedy Duncan reports eighteen industrial fellowships in applied science at the universities of Kansas and Pittsburgh, supported by various industries for the discovery of improved processes and the utilization of waste products. The University of Wisconsin has some of its graduate students giving half their time to State work under the insurance, tax, and railroad commissions. The working fellowships carry a salary of \$600. The University of Wisconsin also has a system of teaching fellows who devote alternate semesters to teaching in the high schools of the State and to graduate work at the university.

SCHOOLS OF JOURNALISM. The immense development of periodical literature in this country has given rise to a demand for specific training in journalism and many universities, chiefly in the West, have in recent years made

more or less formal provision for it; but Columbia has now the best opportunity to cultivate this field, for the million dollars which Joseph Pulitzer, editor of the *New York World*, gave to that university in 1904 became available for that purpose at his death. If at the end of three years the school of journalism is in successful operation another million will be added. The donor designated an advisory committee composed of the editors of the leading New York papers and other experts to have general oversight of the school and to provide in his will for numerous scholarships and prizes for literary production. A building of five stories and a basement, measuring 208 feet by 56, is already in the course of erection for the Columbia School of Journalism. The University of Missouri was the first to organize a school of journalism with a distinct faculty and leading to a specific degree, B. S. in J. It is on the same basis as the other professional schools and requires the same attainments for admission, two years of collegiate work. The University of Wisconsin has added to its journalistic courses work in the technique of printing and publishing and in technical and trade journalism, especially agricultural. The following universities also have now departments or courses devoted to journalism: New York, Michigan, Ohio State, Illinois, Kansas, Minnesota, Nebraska, Miami, Oregon, Washington; and Iowa and Massachusetts agricultural colleges. Charles Scribner has given to Princeton University a completely equipped printing plant at a cost of \$125,000.

AIMS AND METHODS. The alumni of Amherst are endeavoring to assist the college in finding its true vocation and place in the educational system of the United States. The class of 1885 at its twenty-fifth reunion presented to the trustees an address on the future development of the college in which it was urged that it was undesirable to attempt to compete with the great universities in technological courses and that the college should confine itself to a definite sphere of collegiate work with the aim of preparing men for public life by a training in cultural studies. The specific recommendations made by the committee of the class were formulated as follows:

1. That the instruction given at Amherst College be a modified classical course.
2. That the degree of bachelor of science be abolished.
3. That the college adopt the deliberate policy of devoting all its means to the indefinite increase of teachers' salaries.
4. That the number of students attending the college be limited.
5. That entrance be permitted only by competitive examination.

The trustees of Amherst received the recommendations favorably and virtually adopted the first three of those given above. With the aid of the alumni a fund was raised to make the salaries of the teachers equal to those paid in any similar institutions. It has not, however, been determined to restrict the number of students. The committee of alumni and educational experts of other colleges appointed by Hamilton College to consider changes in requirements recommended that wider scope be allowed in the choice of subjects for entrance and that Latin and Greek be not required for admission to the A. B. course.

Many universities are raising their requirements for admission to professional schools and for advanced degrees. Columbia University will hereafter require two years of collegiate work for entrance to the engineering courses of four years, thus placing engineering on the same basis as law, medicine, and education. The University of Colorado has raised its law and medical schools to the same requirements. All the professional schools of the University of Missouri except the College of Agriculture will hereafter require two years of college. Oberlin has placed its conservatory of music upon the same basis of entrance requirements as the collegiate departments. New York University will hereafter require for doctor of philosophy and doctor of science a written as well as an oral examination, and three years of resident graduate study, of which one must be spent at the university.

In Yale University the conduct of work for the master of arts degree has been transferred from the faculty of Yale College to that of the Graduate School and regulations for the degree have been made more severe. Hereafter not less than two years of graduate study will be required for the M. A. degree, of which the last year must be spent at New Haven. New rules have been adopted restricting the freedom of elections in Yale College, particularly in the freshman and sophomore years, by means of a group system to insure a better distribution of courses.

Summer schools are advancing rapidly both in numbers and quality of work. Johns Hopkins conducted a summer session of six weeks in 1911, attended by 335 persons, mostly local teachers. Dartmouth has incorporated its summer school as an integral part of its educational system, establishing the same standards and giving equal credit for work done. New York University will hereafter permit all of the work for a master's degree to be done in the summer school. Cornell will permit henceforth two terms of summer work, instead of one as formerly, to count among the eight terms of residence required for the bachelor of arts degree.

The University of Chicago has obtained from its instructors, undergraduates, and alumni a large amount of detailed criticism and results of personal experience bearing on problems of instruction which is summarized in the *University of Chicago Magazine*. It was found that there were some courses requiring little or no preparation, but that these were not always the least valuable. On the other hand, some instructors made "impossible demands upon the students' time." Lectures as the principal means of instruction, particularly for elementary classes, are, in the opinion of the great majority of instructors, alumni, and undergraduates, unwise. Written quizzes are regarded as a fairer way of grading than oral tests. Students should know their grades.

At Harvard an investigation was made to determine the actual cost of instruction in the different departments. It was found that the average cost per student of all courses in the English department was \$31.69, though it varied greatly in the different courses; for example, the cost of the freshman course in English was \$23.25, while Dean Briggs' course in English cost \$97 per student. The average cost per student in certain departments was

found to be as follows: Botany, \$178.96; mathematics, \$53.88; architecture, \$103.93; philosophy, \$48.69; business, \$117.39; classics, \$73.49. Under the new rules restricting the freedom of election at Harvard, freshmen have to choose the department in which they will do their main work (at least six out of sixteen courses). The preferences expressed by the freshmen in May, 1911, were distributed as follows: 23 per cent. will concentrate their work in the departments of language, literature, fine arts, and music, 30 per cent. in the natural sciences, 45 per cent. in history, government, and economics, and 2 per cent. in philosophy and mathematics. There is a marked increase in the election of scientific courses.

COLLEGE GRADUATES. President Lowell of Harvard presents in *The Educational Review* for October some statistics tending to show that success in the work of the professional school depends more on the grade of work done in the college than on the choice of studies. The students who in college took more work than the average in history and political science did not do better in the law school than the others, and the medical students who had taken more science when in college showed no superiority. Of the men who took ten or more courses in science while in college, only 39 per cent. graduated *cum laude* from the medical school, while of the men who took less than three science courses 61 per cent. graduated *cum laude*. Of the 239 men who received no honors in college 36 per cent. were given honors in the medical school; of the 85 with a *cum laude* in college, 76 per cent.; of the 39 with *magna cum laude*, 87 per cent.; and the two who received *summa cum laude* received honors in the medical school. From this, President Lowell concludes, that, "as a preparation for the study of law or medicine, it makes comparatively little difference what subject is mainly pursued in college, but that it makes a great difference with what intensity the subject is pursued—or, to put the same proposition in a more technical form, familiarity with the subject-matter, which can be transferred little if at all, is of small importance in a college education, as compared with mental processes that are capable of being transferred widely, or with the moral qualities of diligence, perseverance, and intensity of application which can be transferred indefinitely."

Unusually complete and accurate statistics of the earning power of graduates in the earlier years of their career were obtained from the reports of the Yale class of 1906, five years after graduation. Two-thirds of the class reported their actual individual earnings, exclusive of inherited wealth and family allowances. The results are tabulated below by year and occupation. The average age of the class of 1906 at graduation was 22 years and 10 months:

Occupation	1st year	2d year	3d year	4th year	5th year
Finance and mercantile *	\$705	\$1,061	\$1,516	\$1,931	\$2,405
Educational and religious workers	1,110	1,085	1,236	1,328	1,514
Farmers, ranchers, foresters ...	893	1,200	1,560	1,471	1,886

* Including advertisers, publishers, bankers, brokers, business men, insurance agents, manufacturers, and real estate dealers.

Occupation (cont.)	1st	2d	3d	4th	5th
Engineers	650	942	1,852	1,287	1,702
Government employees	850	860	1,165	1,575	2,650
Journalists	660	790	821	920	1,169
Lawyers	358	400	609	927	1,245
Musicians	750	1,100	1,450	1,700	1,350
Graduate students	487	542	426	447	370
Average for all occupations	\$740	\$969	\$1,287	\$1,523	\$1,885

RHODES SCHOLARS. In 1911 sixty-nine men completed their three-years' course at Oxford at the expense of the Rhodes Trust and 74 newly elected scholars entered into residence. Of the whole number of scholars and ex-scholars at Oxford 90 came from the United States, 84 from the colonies and 10 from Germany. The preference is for law, 44 entering the school of jurisprudence and 12 for the B. C. L. degree. Next come natural science, 24; history, 18; letters, 18; "Greats," the essentially classical course, 14; medicine and theology, 10 each, and others scattering. Of about 250 of the Rhodes scholars who had left Oxford up to 1910, 84 are engaged in educational work and 66 in law. As a general rule the Rhodes scholars have not distinguished themselves, either in athletics or scholarship, so much as might be expected from the fact that they are selected from a large number of applicants for their physical and intellectual ability and are older than the average of Oxford students. The list of second and third class honors won by them in 1911 is large, but that of the first is decidedly meager. The confidential reports of their tutors, printed in the fifth annual report of the Carnegie Foundation for the Advancement of Teaching, give an interesting criticism of American education from the Oxford standpoint. The chief complaint is that the American students are less thoroughly trained, that their knowledge is too diffuse and inexact, and that they are lacking in the ability to express themselves and to master a hard subject. But the Americans are given credit for natural ability and earnestness of purpose.

VISITING PROFESSORS. The system of exchanges inaugurated by James Hazen Hyde and the Cercle Français some years ago has developed into an arrangement between Harvard University and the Sorbonne by which Harvard will send to Paris in alternate years a visiting professor and will receive in return every other year a professor from one of the French universities who will take charge of some regular class room instruction instead of giving a few public lectures. Under this new system Prof. William Davis of Harvard began in the fall of 1911 a course of lectures on physical geography at the Sorbonne. Prof. Theobald Smith of Harvard and Prof. Paul S. Reinsch of Wisconsin are the American exchange professors at Berlin this year. The University of Leipzig has arranged a system of exchanges with the United States similar to the Roosevelt professorship at Berlin and Professor Mannington of Wisconsin will be the first to go to Leipzig under this arrangement. European professors lecturing during 1911 at American universities include: Prof. Max Werworn, of Bonn, on physiology; Prof. Charles Diehl, of Paris, on Byzantine history; Prof. Willy Kuenkenthal, of Breslau, on vertebrate morphology; Mr. H. W. V. Temperley, of Cambridge, on English history;

Prof. Inazo Nitobe, of the Imperial University of Tokyo, on Japanese institutions. Prof. Henri Bergson, of the College de France, will lecture on philosophy in Columbia in 1913.

An interesting extension of the exchange idea has been developed by Harvard according to which one of the professors of that university will conduct classes for a month each in four Western colleges: Knox College, Galesburg, Ill.; Grinnell College, Grinnell, Iowa; Beloit College, Beloit, Wis.; and Colorado College, Colorado Springs; and one of the instructors of each of these colleges will be sent out to do graduate work and to act as assistant in one of the larger courses in Harvard. Prof. Albert Bushnell Hart is the first to be sent out from Harvard under this arrangement to the Western colleges where he will lecture on American history. Columbia has adopted a similar exchange system by which Prof. Leighton B. Morse will take the place of Prof. Weld in the department of physics at Coe College, Iowa, for a half year while the latter comes to Columbia.

FOREIGN UNIVERSITIES. The latest edition of *Minerva* (1910-1911) gives the following figures for the attendance in the winter semester, 1909-1910 of the largest universities in the world: Paris, 17,512; Berlin, 14,034; Cairo, 10,449; Moscow, 9516; St. Petersburg, 8955; Vienna, 8269; Munich, 7080; Budapest, 7000; Naples, 6600. There is of course little comparability between such figures as these. A student of the University of Cairo, for example, sitting on the floor of the mosque and repeating the Koran by rote is not to be classed in any but a formal way with a doctor of philosophy at Berlin. Allowance must also be made for the fact that the attendance reported above includes in some cases a considerable proportion of auditors or non-matriculated attendants at lectures. The number of students enrolled in the twenty-one German universities in the summer semester of 1911 was as follows: Berlin, 8039; Munich, 6890; Leipzig, 4592; Bonn, 4070; Freiburg, 2884; Halle, 2451; Breslau, 2432; Heidelberg, 2413; Göttingen, 2353; Marburg, 2192; Tübingen, 2061; Münster, 2007; Strassburg, 1964; Jena, 1817; Kiel, 1700; Würzburg, 1429; Königsberg, 1381; Giessen, 1334; Erlangen, 1030; Greifswald, 1029; Rostock, 834. Total, 54,962. This is an increase of 63 per cent. in ten years. In 1900 the total number of students was 33,700 and in 1909 it was 51,700. The faculties of philosophy and philology have the largest number, 16,158. Then follow medicine, 11,027; law, 11,023; mathematics and natural science, 8442; evangelical theology, 2825; political economy and agriculture, 2729; Catholic theology, 1834; dentistry, 1046; pharmacy, 916; forestry, 170; veterinary surgery, 160. Since 1908, when women were first allowed to matriculate in German universities, their number has rapidly increased, until in 1911 it reached 2552, of whom Berlin had the most, 605. Of the women students 452 are foreigners; one-half of them Russians and one-third Americans. The first woman to occupy a university chair in Germany is Fräulein Woker, a chemist from the University of Bern, who has been called to Leipzig as extraordinary professor. The Swiss universities in 1911 enrolled 10,311 students, of whom 1322 were in the school of technology. Of the 6862 regular students in the seven Swiss universities 1490 were women. The foreign element constituted

52.5 per cent. of the whole. Of the 41,130 students in the French universities, 3954 were women, 45 per cent. of them foreigners. The foreign women students in Switzerland and France are largely Russians.

Germany, France, and England have been occupied during the year with hot discussion over the place of the classics in modern education. The German gymnasium or secondary school which has long been the object of admiration by American educators is now being sharply criticised in its own country, notably by Prof. Wilhelm Ostwald of Leipzig, for its rigidity and conventionality. On the other hand the classicists are making energetic efforts to prevent the further displacement of Greek by English. In France an organized effort is being made to overthrow the secondary curriculum adopted in 1902 which placed on an equality the four courses of Latin-Greek, Latin-modern languages, Latin-scientific, and modern languages-scientific. The leagues of French culture and friends of Latin were formed to restore compulsory Latin, which was met by an opposing society, the Friends of French and Modern Culture. Imposing lists of names distinguished in letters, science, politics, engineering, and commerce were drawn up by both parties. One side brought out the fact that 70 per cent. of the classical students and only 40 per cent. of the non-classical passed the final lycée examinations. The other side showed that in the Polytechnique examinations in French composition of the last ten years the "moderns" were superior. The number of high school students studying Latin has actually increased in France, as it has in America, since it ceased to be required for the universities. The interests involved in the question were political and social rather than educational; for the clerical schools, which the government is replacing by secular schools, were devoted to classical education. The senate after discussing the matter for several sessions adopted an ingeniously worded resolution to the effect that "considering that one of the principal objects of the reform of 1902 was to safeguard Greco-Latin culture by confining it to that part of the clientele of the lycées and colleges which is most apt to receive it and profit by it" the present programme should be maintained. In England the battle raged about the question of compulsory Greek. Oxford and Cambridge are the only universities in Great Britain requiring Greek of all students at entrance and in their pass courses for an ordinary degree. This requirement shuts out from these universities the large and increasing proportion of students who for lack of inclination or opportunity have not taken the classical course in the secondary schools. The chancellor of Oxford, Lord Curzon, and the Hebdomadal council presented among other measures for university reform a proposal to dispense both passmen and candidates for honors from the necessity of taking two ancient languages at responsions. This was rejected by the congregation, which is composed of the instructors and resident graduates of the university, but in 1911 a compromise proposal was introduced which permitted only candidates for honors in science and mathematics to take, in the place of one ancient language, two other studies, French or German and English history, elementary trigonometry, statics and dynamics, physics or chemistry. This was approved in the congre-

gation by a vote of nearly two to one and was championed by Prof. Gilbert Murray, regius professor of Greek, as not only the best terms obtainable but as conducive to the real interests of classical studies. But when the statute was brought before the convocation, the final authority of Oxford, composed of all the graduates who have kept their names on the books, it was defeated by a vote of 595 to 360. The failure of both Oxford and Cambridge to accomplish the reforms, both educational and financial, which in some degree are recognized by all as necessary, has strengthened the demand for a revision of the constitution which shall prevent non-residents from thwarting the purposes of those responsible for the administration and instruction of the university and it is expected that a royal commission will be appointed to effect a reorganization as has been done several times before.

Such a royal commission, with Lord Haldane as chairman, has been for two years engaged in the study of the problems of the University of London, where a large number of scattered institutions of diverse origin and ideals are to be welded together into one harmonious whole. The commission has published three "blue-books" of evidence, containing the views of a large number of English and some American educators upon various phases of administration and instruction, and has made four preliminary reports, the last of which recommends the purchase of a central site in London and the construction of adequate and convenient buildings appropriate in design to the dignity and importance of the university. Two of the leading institutions forming London University, King's College and University College, have combined their architectural departments into one school of architecture and sculpture and an anonymous donor has provided \$150,000 for a building on the University College site adjoining the new chemical laboratories. This building will also house the laboratory for national eugenics, to which the late Sir Francis Galton left the residue of his estate, about \$225,000. The first occupant of the new chair of eugenics is Prof. Karl Pearson, who for many years has carried on this work at University College. King's College, the first institution in England to establish a course of higher education for women, centring round domestic and institutional life, has secured \$300,000 for the endowment of "home science." A congress of the universities of the empire will be held in London, July, 1912, at which 51 universities will be represented and such subjects discussed as interchange of teachers, mutual recognition of entrance tests, the establishment of a central university bureau, etc.

Another independent university will be chartered in England within the next four years at Reading where a university extension college started in 1892 has developed university work and secured an endowment fund of \$1,250,000. Now that the Union of South Africa is accomplished it is proposed to establish a national university, perhaps on the Cecil Rhodes estate of Groote Schuur. The bequest of the late Alfred Beit with other available funds amounts to \$2,500,000 and the nine colleges now in the Union would form a foundation for university work. McGill University, Montreal, in a five-day campaign raised an endowment fund of over \$1,500,000.

The Prussian ministry of education has approved of plans for a new university at Frankfurt-on-the-Main to be opened in 1914. It will comprise three faculties—philosophy, law, and medicine; but not, like all the other German universities, theology. The municipality already spends about \$450,000 on hospital laboratories and other institutions which will form part of the university and a fund of \$400,000 has been raised, mostly by subscription, to start the university. The Hungarian minister of education proposes to establish two new universities in Hungary, at Pressburg and Debreczen; the first to include faculties of medicine, science, and law, and the second, law, letters, and science, and Protestant theology. The facilities for higher education in India are likely to be increased by the establishment of a Mohammedan university at Calcutta, and a Hindu university at Benares. For the former an income of \$165,000 has been provided and for the latter an endowment of \$1,000,000 has been raised, chiefly by native subscription. The emperor at the Delhi durbar made a liberal donation to Indian education.

BIBLIOGRAPHY. Among the important educational books of the year were: *Educational Problems*, by G. S. Hall; *Cyclopædia of Education*, by P. Monroe; *Latin and Greek in American Education*, by F. W. Kelsey; *Chapters from School College and Character*, by L. R. Briggs; *Woman and the University*, by D. S. Jordan; *Higher Education as a Training for Business*, by H. P. Judson; *Universities of the World*, by C. F. Thwing; *Household Administration; its Place in the Higher Education of Women*, by A. Ravenhill and C. J. Schiff. See also **EDUCATION IN THE UNITED STATES**.

Further information covering the leading universities and colleges will be found in separate articles devoted to them in this **YEAR BOOK**.

UPHUES, JOSEPH. A German sculptor, died January 2, 1911. He was born at Sassenberg in 1850. He studied at the Berlin Academy in the studio of Begas. Many of his sculptural groups are erected in Berlin. Among these are a statue of Frederick the Great and several of the groups which ornament the Siegesallee. He executed the Kaiser Wilhelm monument at Düren and one of Bismarck at the same place, and one of the Kaiser and Kaiserin at Homburg. A replica of his statue of Frederick the Great was presented to the United States by the Emperor William and was erected in the War College grounds at Washington.

UPPER-SENEGAL AND NIGER. An inland French colony in French West Africa (q. v.), having an area of 819,360 sq. kilometers and a population recently estimated at 4,663,326 (832 French). Bamako, with (1909) 6579 inhabitants, is the capital. Exports of rubber in 1909, 1,930,316 francs. The imports were valued in 1909 at 2,342,192 francs and the exports at 3,159,996. There is a railway from Koulikoro to Kayes. Telegraph lines, 8396 kilometers, telephone, 35. The revenue was estimated for 1909 at 7,363,838 francs, and the expenditure at 7,196,364. The entire colony is under civil government and is administered by a lieutenant-governor (M. F. Clozel in 1911) acting under the direction of the governor-general of French West Africa.

URUGUAY. A republic on the coast of South America between Brazil and Argentina. The capital is Montevideo.

AREA AND POPULATION. With an estimated area of 72,210 sq. miles, Uruguay is the smallest South American republic. The census of October 12, 1908, showed a population of 1,042,668, and the 1910 estimate 1,112,000. Movement of the population is shown by the following figures, for 1909 and 1910 respectively: Births (including stillbirths), 35,663 and 35,927; deaths (including stillbirths), 15,249 and 16,515; stillbirths, 1287 and 1307; excess of births, 20,414 and 19,412; arrivals, 165,638 and 119,684; departures, 145,534 and 105,683; marriages, 6591 and 6918. In 1910 the department of Montevideo (256 sq. miles) had an estimated population of 324,451. The city of Montevideo has about 315,000 inhabitants. There is no other large city, the principal towns being Paysandú (with about 19,000 inhabitants), Salto (18,000), Mercedes (15,000), Florida (12,500), San José (12,100).

EDUCATION. Primary instruction is free and nominally compulsory. In 1909 public primary schools numbered 790, with 76,042 pupils enrolled; private primary schools, 263, with 19,028. During 1910 210 new schools were opened, and the enrollment at the end of that year was about 117,000. There is a number of establishments for secondary education. The new buildings of the national university at Montevideo were dedicated January 22, 1911.

PRODUCTION AND COMMERCE. A large portion of the country is utilized for grazing, and only about 2.5 per cent. of the total area is under cultivation. The principal crops are wheat and corn; others of some importance are linseed, oats, barley, tobacco, olives, and grapes. Stock-raising affords the principal source of wealth. According to the livestock census of 1908 there were 8,192,542 cattle, 24,730,289 sheep, 556,297 horses, 17,581 mules, 4358 asses, 180,197 swine, and 19,951 goats. Many minerals are known to occur, but mining is little developed. There are a few manufacturing industries in Montevideo, but the country depends almost entirely on the importation of foreign goods.

Final official details of Uruguayan commerce for 1910 are not available. The following values, stated in thousands of gold pesos, have been reported for the special trade:

	1907	1908	1909	1910
Imports	37,471	38,730	37,157	41,151
Exports	34,912	40,296	46,150	41,666

The leading imports are textiles (about 8,200,000 pesos in 1908), food products (7,686,000), earthenware (4,060,000), iron and steel, beverages, lumber, etc., chemicals and drugs, oils, tobacco, and paper. In 1908 and 1909 the exports of livestock products were valued at 37,770,415 and 41,596,126 pesos respectively; agricultural products, 2,184,209 and 2,860,515. The principal exports in those two years are reported as follows: Wool, 17,429,121 and 19,317,304 pesos; hides and skins, 10,267,124 and 11,543,140; meats and extracts, 5,878,682 and 6,401,195; grain and seed, 1,760,258 and 2,343,552; live animals, 1,764,614 and 1,854,769; fats, 1,639,430 and 1,657,619; hair, 347,839 and 354,178; flour, meal, etc., 249,343 and 324,131. Imports from and exports to the principal countries in 1908 (the latest year for which complete figures are available) were as follows, in thousands of pesos: Great Britain, 12,126 and

2772; Germany, 6439 and 6900; France, 3765 and 9142; United States, 3457 and 3890; Italy, 3172 and 1461; Argentina, 2554 and 8474; Belgium, 2277 and 4156. In 1909 there entered 4869 vessels, of 7,514,385 tons (7,184,287 at Montevideo). The merchant marine in 1911 comprised 30 steamers, of 23,960 tons net, and 62 sailing vessels, of 27,178 tons net.

COMMUNICATIONS. The reported length of railways in operation at the end of 1910 was 2638 kilometers; under construction, 580 kilometers. A considerable amount of trackage was completed in 1911; early in November occurred the official inauguration of the Treinta y Tres Central Uruguayan Eastern extension. Telegraphs (1910), 319 offices, with 7804 kilometers of line; telephones, 4803, with 34,614 miles of wire; post offices, 1018.

FINANCE. The monetary standard is gold, and the unit of value the peso (coined only in silver), worth \$1.034. The budget for the year ended June 30, 1910, showed an estimated revenue of 21,079,880 pesos and an estimated expenditure of 21,075,330 pesos. The larger items of estimated expenditure were: Debt, 10,255,357 pesos; war and marine, 3,057,378; interior, 2,997,013; industry and public instruction, 1,572,257; finance, 1,371,456. The budget submitted for the fiscal year 1912 showed an estimated revenue of 28,534,000 pesos and an estimated expenditure of 28,533,619 pesos. Customs revenue in the fiscal year 1911 amounted to about 16,000,000 pesos.

During 1910 the debt was reduced by 1,576,908 pesos, standing at the end of the year as follows: External consolidated, 123,309,818 pesos; international, 2,475,500; internal, 8,443,558; total, 134,228,876.

ARMY. The budget of 1910-1911 provided for a military strength comprising a general staff of 30 officers, an administrative bureau of 20 officers, and 100 civil employees, 2 regiments of field artillery with 86 officers and 600 men, 1 Maxim-Vickers battery of 6 officers and 100 men, 1 battery of fortress artillery with 6 officers and 100 men, 1 machine-gun company with 6 officers and 100 men, 3 sections of artillery, each with 2 officers and 20 men, a presidential escort of 6 officers and 100 men, 10 regiments of cavalry with 196 officers and 2550 men, 8 squadrons of cavalry with 48 officers and 600 men, 8 battalions of infantry with 160 officers and 2400 men, 9 companies of infantry with 54 officers and 720 men, 1 company of engineers with 8 officers and 100 men, 1 military academy with 16 professors and 50 students, a bureau of military justice with 26 officers, and a national arsenal of 15 officers and 150 employees, 13 generals and 82 cannon and machine-guns. The troops, both infantry and artillery, have modern weapons. In addition to the permanent army, there are 5000 men in the police force, and a national guard of about 100,000 men, with 120 cannon organized in 3 bans.

NAVY. In 1911 the navy included: One armored cruiser (the *Montevideo*), of 2200 tons; 1 torpedo cruiser (the *Uruguay*, 1910), of 1500 tons; 4 gunboats, aggregating 2800 tons; 5 dispatch boats; 1 schoolship. Personnel, 60 officers and 600 men. There were 4 gunboats under construction.

GOVERNMENT. The executive authority is vested in a president, elected by the General Assembly for four years and assisted by a responsible ministry. The legislative power de-

volves upon the General Assembly, which consists of the Senate (19 members) and the House of Representatives (75). The president for the term beginning March 1, 1907, was Claudio Williman. His successor, José Batlle y Ordóñez, who was president in 1903-7, was inaugurated March 1, 1911.

UTAH. The Thirteenth Census showed a population in 1910 of 373,351, compared with 276,749 in 1900, an increase of 34.9 per cent. in the decade. The principal cities with their population in 1910 and 1900 are given below (the figures in parenthesis are for 1900): Salt Lake City, 92,777 (53,531); Ogden, 25,580 (16,313); Logan, 7522 (5451).

AGRICULTURE. The Thirteenth Census included statistics of agriculture. These are of date of April 15, 1910. On that date the number of all farms in the State was 20,676, as compared with 19,387 in 1900. The land in farms was 3,397,699 acres, as compared with 4,116,951 acres in 1900, a decrease of 719,252 acres. The improved land in farms in 1910 was 1,368,211 acres, as compared with 1,032,017 acres in 1900. The average acreage per farm in 1910 was 156.6, as compared with 212.4 in 1900. The value of the farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$150,795,201, as compared with a value in 1900 of \$75,175,141, an increase of \$75,620,060. The average value of all farm property per farm in 1910 was \$6957 as compared with \$3878 in 1900. The average value of land per acre in 1910 was \$29.28 as compared with \$9.75 in 1900. Of the 21,676 farms in 1910, 19,956 were operated by owners and managers and 1720 by tenants. Of the farms operated wholly or in part by owners those free from mortgage in 1910 numbered 15,131, those under mortgage, 4492. Of the total number of farms, 15,948 were owned or managed by native white farmers, 5452 by foreign-born whites, and 276 by negroes or other non-whites. Of the non-whites 200 were Indians, 52 Japanese, 13 Chinese, and 11 negroes. The value of the various kinds of domestic animals, poultry, and bees in 1910 was \$28,781,691, as compared with a value in 1900 of \$21,474,241. The cattle numbered 412,334, valued at \$8,948,702; horses and colts, 115,676, valued at \$9,999,835; mules, 2277, valued at \$157,497; swine, 64,286, valued at \$445,653; sheep and lambs, 1,827,180, valued at \$8,634,735. The poultry of all kinds numbered 691,941, valued at \$327,908. The acreage, production, and value of the principal crops in 1910 and 1911 are shown in the following table:

		Acreage	Prod., bu.	Value
Corn	1911	8,000	280,000	\$227,000
	1910	7,000	212,000	178,000
Wheat	1911	225,000	5,025,000	3,518,000
	1910	198,000	4,730,000	3,671,000
Oats	1911	87,000	3,889,000	1,828,000
	1910	85,000	3,655,000	1,754,000
Rye	1911	5,000	78,000	55,000
	1910	5,000	92,000	63,000
Potatoes ..	1911	15,000	2,100,000	1,785,000
	1910	14,000	1,988,000	1,173,000
Hay	1911	380,000	3,950,000	8,550,000
	1910	380,000	1,140,000	10,260,000
a Tons.				

MINERAL PRODUCTION. The State is one of the larger producers of copper. The output in 1910 was 125,185,455 pounds of blister copper, as compared with 101,241,144 pounds in 1909. The in-

crease was due to the production from the Bingham district.

The coal production of the State in 1910 was 2,517,809 short tons, valued at \$4,224,556. In 1909 the production was 2,266,899 short tons, valued at \$3,751,810. The production was affected only slightly by the coal strikes in the Middle West. The increased production is looked upon as only an indication of normal growth that may be expected to continue as the country develops in population and industrial enterprises. There were employed in the coal mines of the State in 1910, 3053 men. These were kept steadily employed.

The production of copper in Utah in 1911 showed a decided increase over the output of 1910. The main output as in the previous years was derived from the Bingham district, though the Tintic district contributed an important amount and the Frisco district made a larger production than in 1910. The most important events of the year affecting the industry in the State were the completion of the Bingham and Garfield Railway connecting the mines and mills of the Utah Copper Co., and the remodeling and enlargement of this company's mills.

The State is a large producer of gold and silver. The production of gold in 1910 was 195,052 fine ounces, valued at \$4,032,085. In 1911 the output was 227,834 fine ounces, valued at \$4,709,747. The production of the silver in 1910 was 10,466,971 fine ounces, valued at \$5,652,164. The silver production in 1911, according to the preliminary estimates of the director of the mint, showed a large increase. The State ranked first in the output of silver in the latter year. The production was 12,679,633 fine ounces, valued at \$6,973,798.

FINANCE. The report of the treasurer for the biennial period 1908 to 1910 showed a balance on hand November 30, 1908, of \$258,833. The receipts for the period were \$6,157,126. The total disbursements amounted to \$5,153,220, leaving a balance on hand November 30, 1910, of \$902,739.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the Deaf and Dumb Asylum, the Insane Asylum, Institution for the Blind, Miners' Hospital, the Reform School, and the State Prison.

POLITICS AND GOVERNMENT

The State legislature met in 1911 and the most important measures enacted will be found in the paragraph *Legislation*, below. On January 17 George Sutherland was reelected to the United States Senate without opposition. There was no State election during the year, but municipal elections were held on November 7. In Salt Lake City the first elections were held under the commission form of government imposed upon the city by the legislature without the consent of the voters of the city. The mayoralty candidates were Samuel C. Park, who was supported by the Citizens' ticket, and John S. Bransford, the candidate of the American party. The entire Citizens' ticket was elected by majorities of about 5000 in a total vote of about 25,000. In addition to the mayor, who is called the mayor-commissioner, two 2-year commissioners and two 4-year commissioners were also elected. Mr. Bransford, the defeated candidate of the American party, had been mayor for four years.

LEGISLATION. Important measures passed at the legislative session of 1911 included the following: A measure vesting the municipal government of all cities of the first class in a board of five commissioners, consisting of a mayor and four commissioners, and in cities of the second class in a board of commissioners consisting of a mayor and two commissioners, to be known as the board of commissioners of the respective cities. These commissioners are to be chosen at the general election in November, 1911, and are to assume office on the first Monday of January, 1912. The executive and administrative powers, authorities, and duties not possessed by the mayor and council of the respective cities are distributed among five departments: Department of public affairs and finance; department of water supply and water works; department of public safety; department of streets and public improvements; and department of parks and public property. In cities of the first class a mayor and two commissioners shall be elected for a term of four years, and two commissioners for a term of two years, and thereafter, biennially, two commissioners shall be elected for a term of four years, and quadrennially thereafter the mayor shall be elected for a term of four years. The commissioners in both classes of cities have the appointment of city officers other than auditor, who shall be elected. This will affect Salt Lake City of the first class, and Ogden City, Provo City, and Logan City of the second class. A child labor law was passed preventing the employment of any children under the age of 14 years in certain designated employments, including coal mines, cigar factories, breweries, distilleries, etc. Restrictions were also placed on the employment of females under the age of 21, and no boy under the age of 14 years or no girl under the age of 16 years is permitted to work in any gainful occupation other than domestic service, fruit or vegetable packing, or work on a farm, more than 54 hours in one week. Measures were passed prohibiting the selling or giving away of cigars, cigarettes, or tobacco in any form, or opium or other narcotic in any form to any person under 21 years of age, except upon the prescription of a physician. Provision was made for the employment of convict labor for the construction of State roads.

STATE OFFICERS. Governor, William Spry; Secretary of State, C. S. Tingey; Treasurer, David Mattson; Auditor, Jesse D. Jewkes; Attorney-General, A. R. Barnes; Superintendent of Education, A. C. Nelson; Commissioner of Insurance, Willard Done—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Joseph E. Frick; Justices, W. M. McCarty and Daniel N. Straup; Clerk, H. W. Griffith—all Republicans.

LEGISLATURE, 1911. Senate, Democrats, 2; Republicans, 16; total, 18. House of Representatives: Democrats, 7; Republicans, 38; total, 45.

The representatives in Congress will be found in the article UNITED STATES, section *Congress*.

VAGRANCY. Increasing attention has been given during the past few years to the problem of vagrancy, and during 1911 New York and Wisconsin took long steps towards its solution. Mr. James Forbes, secretary of the National Association for the Prevention of Mendicancy,

estimates the number of tramps in the United States at 350,000. Of these probably 75,000 belong to the aristocracy of the tramp world, that is, they are professional idlers roaming about over the country, living by begging, petty larceny, and other more serious crimes. The vast majority of tramps he classifies as "occasional vagrants." They work part of the time, but a great deal of the time live by begging, especially in cities and by deceiving mission workers and clergymen. A third class are the transient workers, who labor in the wheat fields, on the lake steamers, or in northern lumber camps, according to season. Finally there are the "mush fakers," or the superannuated tramps, who make a pretence at some such trade as umbrella mending. The ranks of vagrants are depleted by a very high mortality, by almshouses, prisons, and hospitals. They are recruited from the unemployed and by boys enticed into the life by either professional tramps or boys who have had some experience in wandering. They are most numerous along the main lines of railroads and have their favorite places of congregation at railroad centres and cities. They have become fairly well-organized, with an ingenious system of conveying information and a well-developed code of tramp ethics, as well as a tradition of how to succeed. The perfection of their organization is shown by the tramp conventions which have been held in recent years in various cities from Montreal to San Francisco.

NEW YORK FARM COLONY. The New York legislature passed a law establishing an industrial farm colony for "the detention, humane discipline, instruction, and reformation" of males over twenty-one years of age committed as tramps or vagrants. This is the first adoption in the United States of the plan of handling vagrants which has proven very effective in Switzerland, Belgium, and Germany. The colony is placed under the control of an unsalaried board of seven managers to be appointed by the governor. This board will appoint a superintendent and other employees of the colony, establish rules and regulations for administration, and formulate a system of penalties and credits. It may also determine the site and erect buildings for the housing and for the educational and industrial training of not fewer than five hundred inmates. The law requires that the labor of inmates shall be used as far as possible in the construction and improvement of the colony. The law states that commitments may be made by any judge after the colony is ready, "but no person shall be so committed who shall satisfy the court or magistrate that he supports himself through lawful employment. It is the intent and meaning of this act that workmen temporarily out of work and seeking employment shall not be called tramps or vagrants and be committed as such to the said colony." Commitments shall not be for a definite term and any inmate may be paroled or discharged by the board of managers. No one may be detained in the colony more than two years and no one who has not previously been admitted to a penal institution may be detained more than eighteen months. The board of managers of the colony was named by Governor Dix November 29 as follows: Orlando F. Lewis, secretary of the Prison Association of New York; Judge Joseph Beal, Oneida; George F. Warren, Cornell University; Samuel Untermyer,

New York; Frederic Almy, Buffalo; Michael J. Drummond, New York; and John G. O'Keeffe, New York.

Wisconsin authorized a new and very important authority, the Wisconsin Industrial Commission, with power to provide industrial or agricultural training for vagrants and others. This law was effective September 1, 1911. It would appear that the handling of the problem of vagrancy in that State may be expected to set a high standard of efficiency for other American States.

VALPARAISO UNIVERSITY. An institution of higher and secondary learning at Valparaiso, Ind., founded in 1873. The number of students enrolled in all departments of the university in 1910-11 was 5551. The faculty numbered 191. Seven new members were added to the faculty during the year. No noteworthy benefactions were received. The income for the year 1910-11 was about \$300,000. Plans were being prepared for a new law building during the summer of 1911, and the facilities for manual training and civil engineering were enlarged. The library contains about 15,000 volumes. President, 1911, Henry B. Brown, A. M.

VANCE, WILSON. An American soldier and writer, died November 10, 1911. He was born in Findlay, Ohio, in 1845, and was educated in the common schools. He enlisted as a private in the 21st Ohio infantry and served throughout the Civil War. He was awarded a medal of honor for gallantry at the battle of Stone River. He studied law at the Harvard Law School in 1855-7, and in 1870 became editor of the *Ohio State Journal*. He was connected with many other papers in an editorial capacity in Washington, Cincinnati, St. Louis, Chicago, Philadelphia, and St. Paul. In 1904 he became editor of *The Square Deal*, in which position he remained until the time of his death. He was the author of *Princes' Favors* (1879); *Little Amy's Christmas* (1879); *God's War* (1899), and *Big John Baldwin* (1909).

VANDALIUM. See **CHEMISTRY, INDUSTRIAL.**

VANDERBILT UNIVERSITY. An institution of higher learning at Nashville, Tenn., founded in 1872. There were enrolled in all departments of the university in 1911-12, 1100 students. The faculty numbered 120. There were received during the year 1910-11 two notable benefactions, one of \$150,000 from the general education board for endowment, and one of \$150,000 from Mr. W. K. Vanderbilt for the medical department. There was acquired during the year a special campus of 16 acres for the medical and dental departments. This campus has been greatly improved; the buildings were enlarged, and the work of the department was reorganized. The productive funds of the university amounted to \$1,800,000, and the income to about \$185,000. The library contains about 45,000 volumes. President, 1911, J. H. Kirkland, LL. D., D. C. L.

VANDERPOEL, JOHN HENRY. An American artist and teacher, died May 2, 1911. He was born at Haarlemmer-Meer, Holland, in 1857. He came in early youth to the United States, and was educated in the public schools of Chicago. He studied drawing and painting in Paris. Returning to the United States he became a member of the New York Water Color Club. He was for thirty years teacher of drawing and

painting in the Art Institute of Chicago. He was the author of *The Human Figure* (1907).

VAN DYKE, HENRY. See **LITERATURE, ENGLISH AND AMERICAN, Poetry.**

VASSAR COLLEGE. An institution for the higher education of women at Poughkeepsie, N. Y. The total number of students in the college is limited to about 1000. The total attendance in 1911-12 was 1055. The faculty numbered 111. Among the changes in the faculty during the year were the following: Prof. O. S. Tonks of Princeton University took charge of the art department in the place of Professor Pilcher, resigned; the departments of psychology and philosophy were separated and made independent departments under the same professors as before. Among the gifts received during the year were \$225,000 from Mrs. Russell Sage for a new residence hall to be called the Olivia Joselyn; and \$10,000 from Mr. and Mrs. W. S. Johnson of Canandaigua for the establishment of a scholarship in memory of their daughter. The productive funds of the college amounted to \$1,439,000, and the income to about \$64,000. The library contains about 70,000 volumes. President, 1911, James W. Taylor, D. D., LL. D.

VAHLEN, JOHANNES. A German philologist and educator, died November 30, 1911. He was born in Bonn in 1830 and was educated at the University of Bonn. While still a student he showed extraordinary abilities. At the age of 24 he edited fragments of Ennius, and in the same year became privatdozent at Bonn. In 1856 he was called to Breslau as professor extraordinary, and two years later he went to Freiburg as full professor. In the same year he was called to the University of Vienna, where he remained for 16 years. He became professor of Latin at the University of Berlin in 1874, and this position he held until the time of his death. His lectures were attended by American students in large numbers. They included nearly all Latin writers and were elaborated with great care. It was said of him that no European scholar spoke and wrote Latin with equal purity and facility. He wrote many works dealing with Latin and Greek texts, the best known of which is perhaps his edition of Aristotle's *Poetics*, with a Commentary published separately. For several years he was co-editor of the periodical *Hermes*.

VAUGHAN, General Sir JOHN LUTHER. An English soldier, died January 2, 1911. He was born in 1820 and was educated at Rugby. In 1840 he was appointed to a cadetship in the Bengal army, landing in Calcutta. In 1841 he was nominated ensign in the Twenty-first Native infantry. Two years later he was appointed to the staff of General Littler and participated in an attack on the Gwalior army by an English force under Lord Ellenborough. On the conclusion of this affair he was appointed adjutant. In 1848 he was recommended by Henry Lawrence to the governor-general and was appointed second in command in the Fifth Punjab infantry. He served with that body of troops for twenty-four years. In 1855, after having been fourteen years in India, he returned to England on sick leave, but participated in service in the Crimea. On the conclusion of peace he returned to India and again commanded his regiment. In 1857 he took part in several engagements in which he was conspicuous for efficiency and gallantry. In 1859 he commanded a small field force on the frontier of Nepal. In 1863 in the Unweyla cam-

paign he displayed great skill and daring and was rewarded with the distinction of the Companionship of the Bath. He was appointed to command the Gwalior district in 1869. This ended his twenty years' service with the frontier force. He was appointed honorary colonel of the Fifty-ninth Vaughan's Rifles, and at the age of 50 retired from the army with the rank of major-general. He was nearly the last of the group of soldiers who, under the leadership of Henry Lawrence, introduced law and order into the Punjab. In the second Afghan War he acted as military correspondent for the *London Times*, and accompanied Lord Roberts to Kabul and Kandahar. He wrote *My Service in the Indian Army and After* (1905).

VEDDAS. See ANTHROPOLOGY.

VENEZUELA, UNITED STATES OF. A republic of South America, lying east of Colombia. The capital is Caracas.

AREA AND POPULATION. By the constitution promulgated August 5, 1909, the republic is divided into twenty states, two territories, and one federal district, covering altogether on area of 1,020,400 sq. kilometers, or 393,976 sq. miles. The population according to the census of 1891 numbered 2,323,527, a density of 2.27 to the sq. kil.; estimated 1910, 2,685,440; 1911, 2,713,703. The marriages in 1910 numbered 8120; births, 82,487; deaths, 55,436; arrivals, 8420; departures, 7374. Caracas has about 73,000 inhabitants; Maracaibo, 50,000; Valencia, 40,000; Barquisimeto, 32,000; Puerto Cabello, 14,000; La Guaira, 12,000.

EDUCATION. The number of pupils receiving elementary education in the last quarter of 1909 was 48,148 (26,670 boys and 21,478 girls). Of these, 31,850 (17,988 boys and 13,862 girls) were in the national schools (1004); 4723 (2594 and 2129) in the federal schools (146); 7564 (3534 and 4030) in the municipal schools (225); 4011 (2554 and 1457) in private schools (150). The total pupils in all schools in 1907 was 35,786; in 1905, 35,814. There are two universities and a few higher and technical institutions. Roman Catholicism is the national religion.

PRODUCTION. The establishment of the refrigerating plant at Puerto Cabello has done much to benefit the cattle-raising industry, which in recent years had declined. Coffee, cacao, balata, and rubber are produced for export. Sugar-cane is raised, and a sugar-mill is to be erected in the neighborhood of Valencia. Many projects for industrial development are contemplated.

Asphalt and petroleum exist in workable quantities. Lack of transportation facilities has hindered the development of the rich mineral resources.

COMMERCE. The trade for three years (ending June 30) is shown below in bolivars:

	1909	1910	1911
Imports	49,180,484	56,640,971	80,178,933
Exports	83,145,315	86,419,582	96,920,228

Total imports for year ending June 30, 1905, 48,434,143 bolivars; 1906, 44,952,867; 1907, 51,679,088; 1908, 54,420,660. Exports: 1905, 72,516,050 bolivars; 1906, 80,982,119; 1907, 81,019,864; 1908, 78,145,218.

The principal articles of export are given, with values in thousands of bolivars, for fiscal years, at the top of the next column.

	1905	1909	1910	1911
Coffee	31,000	40,492	37,104	43,111
Cacao	12,667	17,904	17,424	18,605
Balata	6,680	6,728	10,189	12,387
Cow hides	5,366	4,647	5,923	4,520
Rubber	398	2,398	2,805	2,074
Gold	2,099	1,592	1,660	2,914
Goat skins	1,305	1,477	1,868	2,367
Cattle	6,480	1,049	1,101	942
Asphalt	1,328	744	924	1,013

The principal countries of origin and destination are given below, with the value of their trade in millions of bolivars:

	Imports			Exports		
	1907	1910	1911	1907	1910	1911
Great Britain....	19.6	15.2	23.7	7.0	9.7	10.7
United States....	13.1	18.5	20.9	29.8	31.1	31.6
Germany	10.2	10.7	13.8	5.0	8.3	15.7
France4	3.8	9.6	20.4	26.7	26.8
Netherlands	4.8	3.9	6.0	9.6	4.3	4.2
Spain	1.7	2.8	3.1	2.8	3.2	5.3
Italy	1.6	1.5	2.6	.4	.2	.4
Belgium3	.3	.5	.0	.0	.1

Vessels entered (1910), 994, of 1,151,334 tons. The merchant marine consisted of 8 steamers, of 2046 tons, and 15 sailing vessels, of 2432.

COMMUNICATIONS. Railways extend from the coast into the interior; but as they are not connected to form a system, they offer only inadequate transportation facilities. Total lines in operation (1910), 12, aggregating 872 kilometers (542 miles); with about \$40,000,000 invested capital. A three-mile extension of the Central Railway to Santa Lucia was completed in 1911. A concession was granted for a line from the Orinoco to El Callao, to be finished in four years. There are over 6000 miles of navigable waterways, and a coastwise steamship service is maintained. Telegraph lines (1910), 7839 kilometers. Telegraph offices, 179; post offices, 282.

FINANCE. The bolivar (worth 19.3 cents) is the unit of value. Financial statistics are given below for three years, ending June 30, in bolivars (1911 budget):

	1909	1910	1911
Revenue	50,410,133	48,552,857	48,000,000
Expenditure	47,668,810	52,337,125	48,000,000

The 1911 estimate does not include 1,250,000 bolivars extraordinary. The 1912 budget was estimated to balance at 51,131,250 bolivars, exclusive of 2,302,327 bolivars extraordinary. The principal sources of revenue in 1910 (as compared with 1909, in parentheses) were as follows: 40,492,192 bolivars from taxes on industries (40,196,114), of which 21,417,309 from customs (19,386,295); 3,513,500 from rent or sale of government lands, salt deposits, and pearl fisheries (5,147,702); 1,700,875 from duties on deeds and contracts (2,965,302); 998,844 from revenue-earning administrations (862,773); 8000 from special enterprises (58,428). Main avenues of expenditure: 18,349,752 for finance, etc. (14,684,033); 12,136,410 for internal administration (7,843,556); 9,611,531 for war and marine (9,113,535); 3,475,295 for agriculture, commerce, and industry (3,110,381); 3,106,051 for public instruction (2,961,139); 1,578,433 for public works (1,992,931); 918,122 for foreign affairs (3,627,993); 3,161,581 extraordinary (4,335,243).

The public debt stood, December 31, 1910, at

107,807,478 bolivars (foreign, 124,011,893; internal, 64,576,036; mixed commissions, 9,219,549).

ARMY. Venezuela maintains an active army consisting of 20 battalions of infantry, each of 400 men; 8 batteries of artillery, each of 200 men, and a battalion of marines. The total strength of the force on a peace footing is about 4000, and a national militia of about 100,000 is maintained on much the same lines as in other South American countries.

NAVY. The navy in 1911 included 3 gunboats, a transport, a tug, a torpedo boat and a dispatch boat. Personnel, 457.

GOVERNMENT. The executive authority rests in a president (1911, Gen. Juan Vicente Gómez, inaugurated June 3, 1910), who holds office for four years at an annual salary of 108,000 bolivars. He is aided by a council of eight ministers. The legislative body is composed of a senate (40 members) and a chamber of deputies—one deputy to every 35,000 inhabitants.

Early in July it was reported that General Castro, former dictator, had returned after his two and a half years' exile and was organizing a revolutionary movement. It was said that he would organize a party of opposition. See **ARBITRATION**.

VENTILATION, EXPERIMENTS IN. See **HYGIENE**.

VERMONT. POPULATION. The Thirteenth Census showed a population in 1910 of 355,956, compared with 343,641 in 1900, an increase of 3.6 per cent. in the decade. The principal cities with their populations in 1910 and 1900 are given below (the figures in parentheses are for 1900); Burlington, 20,468 (18,640); Rutland, 13,546 (11,499); Barre, 10,734 (8448); Bennington, 8033 (6391); Montpelier, 7856 (6266); Brattleboro, 7541 (6640).

AGRICULTURE. The Thirteenth Census included statistics of agriculture. The figures are of the date of April 15, 1910. On that date the farms in the State numbered 32,709, as compared with 33,104 in 1900, a decrease of 1.2 per cent. The land in farms in the State in 1910 amounted to 4,663,577 acres, as compared with 4,724,440 acres in 1900. The improved land in farms amounted to 1,633,965. The average number of acres per farm was 142.6. The total value of farm property was \$145,399,728, as compared with a value of \$108,451,427 in 1900, an increase of 34.1 per cent. The average value of all property per farm was \$4445, and the average value of land per acre was \$12.52. The farms operated by owners and managers numbered 28,701 and those operated by tenants, 4008. Of the owned farms 14,851 were free from mortgage and 13,140 were mortgaged. Of the total number of farms 28,968 were owned by native white farmers, 3721 by foreign-born white farmers and 20 by negro and other non-white farmers.

The domestic animals, poultry, etc., in 1910 were valued at \$22,642,686, as compared with a value of \$17,841,317 in 1900. The cattle numbered 430,314, valued at \$11,828,892; horses and colts, 80,781, valued at \$8,591,357; mules, 429, valued at \$53,540; swine, 94,821, valued at \$974,779; and sheep and lambs, 118,551, valued at \$538,991. The poultry of all kinds numbered 938,524, valued at \$607,787. The acreage, production, and value of the principal crops in 1910 and 1911 are shown in the table in next column.

	Acreage	Prod., bu.	Value
Corn1911	46,000	1,886,000	\$1,509,000
1910	44,000	1,892,000	1,249,000
Wheat1911	1,000	28,000	28,000
1910	1,000	29,000	30,000
Oats1911	76,000	2,660,000	1,569,000
1910	76,000	3,154,000	1,577,000
Potatoes ..1911	26,000	2,730,000	2,157,000
1910	26,000	3,380,000	1,521,000
Hay1911	930,000	a 1,209,000	16,926,000
1910	930,000	1,256,000	15,574,000
Tobacco ..1911	100	b 170,000	27,200
1910	100	160,000	23,200

a Tons. b Pounds.

EDUCATION. The principal features of school legislation in 1911 were as follows: The change of the school year from April 1 to July 1; provision enabling towns to pension teachers who have served thirty or more years; an enactment providing for medical inspection of schools; the transformation of the normal school at Randolph Centre into a State Agriculture School which opened September 26, 1911, with fifty-two students; the establishment of twelve teacher training courses in high schools and academies. To such training courses only seniors and graduates are admitted; the raising of the standard of the normal schools so that hereafter none shall be admitted except high school and academy graduates.

FINANCE. The report of the treasurer for the fiscal year ending July 1, 1911, showed total receipts of \$2,154,880 and disbursements of \$2,180,068, leaving a balance at the end of the year of \$566,141.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the State Prison, House of Correction, Industrial School, and the State Hospital for the Insane.

POLITICS AND GOVERNMENT

There was little of political importance in the State during the year. The legislature met and the most important measures enacted will be found noted in paragraph *Legislation* below.

There were no elections in the State during the year, but the campaign for the governorship in 1912 began to make itself felt distinctly, owing to the attention devoted to the issues of corrupt practices in politics and the revision of tax laws so as to do away with double taxation so-called, and with the burdens borne by the young business man or the young farmer starting out in life and facing the necessity of paying taxes on what he owes as well as on what he owns.

One of the important industrial developments of the year in Vermont was the movement for the building of a railroad to the asbestos region in the northern part of the State, which is said to contain one of the few great deposits of asbestos in the United States, most of this country's supply of this product coming from Canada.

During the year marked progress was made in connection with the movement for the development of the Lake Champlain international water route through the construction of canals between the lake and the Hudson River on the one hand, and the St. Lawrence River on the other, surveys having been begun for the deepening of "the Shallows" in the southern end of Lake Champlain.

LEGISLATION. The important measures passed at the legislative session of 1911 included the

following: Provision was made for maintaining a State Bureau of Information in the office of the Secretary of State, to promote the natural resources of the State by collecting, publishing, and distributing statistics of its natural industrial advantages. Provision was made for the destruction of insect pests such as San José scale, gipsy moth, etc. The office of State ornithologist was created, with the duty of investigating the distribution, food, habits, and utility of the birds of the State, and publishing the information. A measure was passed for the protection of the State from forest fires. A State school of agriculture was established. A system of pensions for teachers was authorized. Child labor throughout the State was regulated. The issuance of free passes by railroads to any persons in addition to those excepted was prohibited. A measure was enacted regulating savings banks and defining the duties of their officers and their investments. The office of commissioner of weights and measures was created. Several important measures were enacted relating to the protection of fish and game. Provision was made for the punishment of murder in the first degree, giving the jury the right to fix the penalty either at death or imprisonment for life. A measure was passed to prevent the white slave traffic.

STATE OFFICERS. Governor, John A. Mead; Lieutenant-Governor, Leighton P. Slack; Secretary of State, Guy W. Bailey; Treasurer, Edward H. Deavitt; Auditor, Horace F. Graham; Attorney-General, J. G. Sargent; Adjutant-General, Lee S. Tillotson; Superintendent of Education, Mason S. Stone; Commissioners of Insurance, E. H. Deavitt and Guy W. Bailey; Commissioner of Agriculture, O. L. Martin—all Republicans.

JUDICIARY. Supreme Court: Chief, Justice, John W. Rowell; Assistant Justices, Loveland Munson, John H. Watson, Seneca Haselton, George M. Powers; Clerk, M. E. Smilie—all Republicans, except Haselton.

STATE LEGISLATURE, 1911. Senate, Republicans, 30; Democrats, 0; Ind. Democrats, 0; Ind. Republicans, 0; House, Republicans, 106; Democrats, 48; Ind. Democrats, 2; Ind. Republicans, 0; joint ballot, Republicans, 226; Democrats, 48; Ind. Democrats, 2; Ind. Republicans, 0. Republican majority, Senate, 30; House, 146; joint ballot, 176.

The representatives in Congress will be found in the article UNITED STATES, section *Congress*.

VERUCA PERUANA. See TROPICAL DISEASES.

VESPASIAN. See NAVAL PROGRESS, *P propulsion*.

VETERINARY SCIENCE. The Bureau of Animal Industry in conjunction with the United States civil service commission continued its investigation and supervision of the courses of study and facilities for instruction at American veterinary colleges. It is now required that the student have instruction for an average of 6½ hours per day on 6 days per week for 25 weeks during 3 years, or a total of 3000 hours' instruction, to be eligible to examination for the meat inspection service. While night instruction is discouraged and has been practically discontinued by all but two colleges, it has been deemed advisable to make provision for such, as there has been a demand for classes after office or work hours, particularly in Washington, D. C. It has therefore been decided to fix the course for night colleges at 20½ hours per week

for 8½ months, as compared with 38½ hours per week for 6½ months for day colleges.

The works of value as text-books in veterinary colleges published during the year include Buchanan's *Veterinary Bacteriology*, Pammel's *Manual of Poisonous Plants*, Sisson's *Veterinary Dissection Guide*, Littlejohn's *Meat and its Inspection*, and Smyth's *Veterinary parasitology*.

The annual meeting of the American Veterinary Medical Association was held at Toronto, August 22 to 25. The officers elected for the ensuing year are: Dr. S. Brenton of Detroit, president; Dr. C. J. Marshall of Philadelphia, secretary; and Dr. G. R. White of Nashville, treasurer.

TUBERCULOSIS. The death of Dr. Saturnin Arloing, the noted French bacteriologist and director of the Veterinary School of Lyon, which took place March 31, at the age of 65 years, removes another leader in the investigation of tuberculosis. During the last 10 years Dr. Arloing gave a large part of his time to the investigation of methods of immunizing cattle against the disease. He was one of the leading opponents of Koch's theory of the non-transmissibility of the bovine type of the tubercle bacillus to man.

The final report of the royal commission appointed to inquire into the relations of human and animal tuberculosis was issued during the year. The actual number of cases representing the various clinical manifestations of tuberculosis commonly found in man that passed under strict observation and on which conclusions were based numbered 128. The lesions in cases of tuberculosis in the adult, especially cases of pulmonary tuberculosis, were referable with but few exceptions to the human type of the bacillus. The fatal lesions in young children dying from primary abdominal tuberculosis could in nearly one-half of the cases be referred to the bovine type of bacillus and to that type alone. In children and often also in adolescents suffering from cervical gland tuberculosis a large proportion of the cases examined could be referred to the bovine tubercle bacillus. The pig, though not capable in the commission's experimental experience of fostering tubercle bacilli of the human type except in a minor degree, may have to be regarded as a possible source of the disease caused in man by that type of bacillus, for the reason that particular glands of the pig's body, which are likely to enter into certain prepared foods, do on occasion yield tubercle bacilli of the human type.

Investigations continued by Doctors W. H. Park and C. Krumwiede, Jr., at the Research Laboratory of the New York City Department of Health, led to the conclusion that in young children the bovine type of the tubercle bacillus becomes a menace to life and causes from 6½ to 10 per cent. of the total fatalities from this disease.

The work of eradicating tuberculosis from the District of Columbia, which was undertaken in the fall of 1909, in order to demonstrate the practicability of eradicating bovine tuberculosis from a given area and in the interest of a wholesome milk supply, was continued during 1911 by the systematic retesting, at intervals of approximately 6 months, of all cattle which had been upon premises found to be infected at the time of the first test and the retesting of all other cattle in the district after an interval of one year, the latter retests not yet being com-

pleted. Cattle were found on 80 of the previously infected premises and the retesting disclosed infection on only 12 of these premises, thus showing a reduction of 85 per cent. in the number of infected premises since the original tests. The number of cattle retested on previously infected premises was 798, of which 764 passed and 34, or 4.26 per cent., reacted. All of the reactors were slaughtered and in every instance post-mortem examination showed lesions of tuberculosis. Annual retests applied to 484 cattle upon 278 premises which appeared to be free from infection at the time of the first test resulted in the discovery of 7 reactors.

Doctors E. C. Schroeder and W. E. Cotton reported the discovery of a new bacterium that is of common occurrence in samples of commercial milk examined at the experiment station of the Federal Bureau of Animal Industry. It was found to be present in the milk of approximately 10 per cent. of a herd of about 150 dairy cows located in the District of Columbia. It reaches the milk of apparently healthy cows before the milk leaves their udders, and it causes in guinea pigs a serious chronic disease, at times closely resembling tuberculosis in its gross pathologic appearance. This bacterium seems to have been overlooked in the past because it does not grow on ordinary culture media and because it is very chronic in its pathogenic action on guinea pigs, which animals it affects both through inoculation and ingestion. The importance of this bacterium still remains to be determined.

Investigations by Dr. G. B. Morse have shown that the growth of certain lumps or tumor-like masses in the subcuticular tissue about the head, neck, and wings of pigeons, and about the heads of Minorca fowls are due to acid-fast bacilli that are not, however, acid-alcohol fast. It therefore appears that this quite common disease of pigeons, usually pronounced tuberculosis on account of finding acid-fast bacilli in the cheesy material, must be recognized as a pseudo-tuberculosis.

FOOT-AND-MOUTH DISEASE. Foot-and-mouth disease, or apthous fever, probably the most rapidly contagious of all epizootics, broke out early in the year, and swept through Europe, and even invaded the British Isles. Reports of the occurrence of this disease during the middle of November showed that there were 20,729 infected herds in 3125 communes in France, 30,341 infected places in 6302 localities in Germany, 4391 outbreaks in 11 provinces in Holland, 25,265 "cours" infected in Hungary, 452 new cases, entailing 4684 animals, in Italy, 19,836 infected animals in Spain, 422,045 cases in 5635 communes in Russia, etc. Eighteen outbreaks, with 467 diseased animals, are reported to have occurred in England. It was estimated in July, at which time there were 16,027 outbreaks in France, that the loss would amount to over 15 million sterling. At last report the president of the board of agriculture and fisheries in Great Britain was about to appoint two experts to proceed to India, where the disease is very prevalent, to cooperate with two experts nominated by the Indian government in a study of the disease.

HOG CHOLERA. Much of the loss which would have resulted from the widespread occurrence of this disease in the United States during the year was prevented through the use of hog-cholera serum. Twenty-one States, including practically

all of those in which hog raising has been an important industry, have made provision for the production of this serum. The use of carbolized or phenolized blood was continued during the year, the later results confirming the earlier observations in showing that the virus of hog cholera may remain in contact with comparatively strong solutions of phenol for weeks, without noticeable impairment of its virulence. There seems to be but little doubt that phenolized blood will gradually come into general use in connection with the simultaneous method of vaccination.

TEXAS FEVER AND THE CATTLE TICK. The work of eradicating the cattle tick was continued by the Bureau of Animal Industry in cooperation with the State and local authorities. Good progress was made, areas aggregating 10,965 sq. miles being released from quarantine during the fiscal year ended June 30, making a total of 139,821 square miles released since the beginning of the work. Experiments in dipping cattle for the destruction of the ticks have shown that arsenical solutions are more satisfactory than the Beaumont crude petroleum, which has heretofore been used to a considerable extent, and arsenical dips are now being principally employed in the work of tick eradication.

DOURINE, or MALADIE DU COIT. Dourine of horses, which had apparently been completely eradicated by the Bureau of Animal Industry a few years before, as a result of several years' work, reappeared in Iowa. While the manner in which the infection was again introduced was not positively determined, it is thought to have been brought in by an imported stallion. Prompt and vigorous action resulted in the practical eradication of the contagion.

LIP-AND-LEG ULCERATION. Lip-and-leg ulceration of sheep, which has been quite prevalent in a malignant form in a large part of Wyoming and Montana within the past three years, was brought under control so well as a result of the work done by the Bureau of Animal Industry and State officials, assisted by favorable climatic conditions, that the federal quarantine was entirely released on August 10.

MALTA FEVER. Malta fever, a disease of goats that may be conveyed to man through the consumption of milk from infected animals and in other ways, was found to occur endemically among goats in the Pecos Valley of Texas.

GLANDERS. In studies made by Doctors J. R. Mohler and A. Eichhorn, of the Bureau of Animal Industry, during the course of an outbreak of glanders at Washington, D. C., it was found that a new laboratory test, known as complement-fixation, is a highly accurate and reliable means of determining doubtful cases of glanders in horses. Previous to this time mallein, although not entirely reliable, has been used for several years in the diagnosis of glanders.

ANTHRAX. The Pasteur vaccination for anthrax has been the method followed in the past in immunizing sheep against anthrax. As this method requires two injections and a month to become protective, it is possible for animals to become infected and die before protection can be afforded them. Investigations conducted by Dr. C. F. Dawson, of the Delaware Agricultural Experiment Station, in cooperation with the federal Bureau of Animal Industry, have resulted in the production of a single vaccine, which, as its name implies, is applied only once, requiring but 15 days for immunity to become established

and only one handling of the animal. The vaccine only differs from Pasteur's vaccine, which is a double vaccine, in its degree of attenuation. An anti-bacterial serum, which will confer a passive immunity immediately and thus protect the animal against fatal infection until the vaccine confers an active immunity, was also produced.

RINDERPEST. This highly contagious disease of various domestic animals was widespread in the Philippine Islands, occurring in 71 municipalities in 20 provinces.

CONTAGIOUS ABORTION OF CATTLE. It was determined by means of the complement fixation test that the cause of this disease, widespread in the United States, is the same as that described by Bang in Denmark, namely, *Bacillus abortus*.

GID IN SHEEP. It was definitely determined by experiments that the tapeworm stage of the gid parasite will develop in coyotes, the coyote as well as the dog being therefore a factor in the spread of this disease.

VICTORIA. A state of the Commonwealth of Australia. The area is stated at 87,884 sq. miles. Final returns of the census of April 3, 1911, show a population (exclusive of aborigines) of 1,315,551, as compared with 1,201,341 in 1901. The percentage of increase was 9.53, as compared with 18.05 for the commonwealth. The capital is Melbourne, with 501,830 inhabitants in 1911 (preliminary returns). Executive authority rests with a governor, who is appointed by the British crown and is assisted by a responsible ministry. The legislative power devolves upon a parliament of two elective houses, the Legislative Council and the Legislative Assembly. The governor, Sir Thomas D. Gibson-Carmichael, was succeeded May 24, 1911, by Sir John Michael Fleetwood Fuller; premier, John Murray. The general elections in November returned 46 Ministerialists and 19 members of the Labor Opposition. See AUSTRALIA; IRRIGATION.

VINTON, ALEXANDER HAMILTON. A bishop of the Protestant Episcopal Church, died January 18, 1911. He was born in Brooklyn in 1852 and graduated from St. Stephen's College in 1873. He studied at the General Theological Seminary and at the University of Leipzig. In 1878 he was ordained priest, and in the same year was in charge of the Church of the Holy Communion in Norwood, N. J. From 1879 to 1884 he was rector of the Church of the Holy Comforter, Memorial, Philadelphia, and from 1884 to 1902 was rector of All Saints', Worcester, Mass. In the latter year he was elected first bishop of the diocese of western Massachusetts. He held several high positions in church conferences and conventions. He was the author of occasional sermons, pamphlets, and addresses.

VINTON, FREDERIC PORTER. An American artist, died May 20, 1911. He was born in Bangor, Me., in 1846. At 15 years of age he entered business, and by the advice of William M. Hunt, the artist, he secured a position in a bank in order to have more time in which to study art. In 1875 he went to Paris, and after a year in the painting school of Léon Bonnat, he went to Munich, where he also remained a year. He returned to Paris in 1877, and entered the atelier of Laurens. In the same year he exhibited a picture at the Salon. He returned to Boston in 1878, and began his career as a portrait painter. He at once achieved success, and painted por-

traits of many men of distinction. Among them were Wendell Phillips, Charles Francis Adams, Prof. A. P. Peabody, Senator Hoar, William Warren, the comedian, and others. In 1882 he again went abroad, this time traveling and studying in Spain. He later traveled in France, Italy, and Holland. In 1888 he was elected an associate of the National Academy and an academician in 1891.

VIRGIN, SAMUEL HENDERSON. An American clergyman and pulpit orator, died September 17, 1911. He was born in Carver, Mass., in 1842. He gained a reputation as an orator when he graduated from the Phillips School in Boston with the first prize for oratory. He entered Harvard College as a member of the class of 1866, but left to become principal of the Leominster High School. He soon left this position to enter the Andover Theological Seminary, and was ordained to the Congregational ministry in 1866. The same year he received a call to the Broadway Church in Somerville, Mass. He was obliged to resign on account of ill health in 1871. During a visit to New York City he spoke in the Tilden Congregational Church and his address so attracted the attention of the members of the church that he was called to the pastorate. He soon gained a reputation as one of the leading pulpit orators of the city. He was one of the founders of the Young Men's Christian Association and the Young Women's Christian Association. In 1886 he received the degree of D.D. from New York University, and in 1890 was given the degree of LL. D. from Iowa University.

VIRGINIA, POPULATION. The Thirteenth Census showed a population in 1910 of 2,061,612, compared with 1,854,184 in 1900, an increase of 11.2 per cent. in the decade. The principal cities with their populations in 1910 and 1900 are given below (the figures in parentheses are for 1900): Richmond, 127,628 (85,050); Norfolk, 67,452 (46,624); Roanoke, 34,870 (21,495); Portsmouth, 33,190 (17,427); Lynchburg, 29,494 (18,891); Petersburg, 24,127 (21,810).

AGRICULTURE. The Thirteenth Census included statistics of agriculture. These are of date of April 15, 1910. On that date the total number of farms in the State was 184,018, compared with 167,886 in 1900. The land in farms was 19,495,636 acres, compared with 19,907,883 acres in 1900. The improved land in farms was 9,870,658, compared with 10,094,805 in 1900. The average acreage per farm was 105.9 in 1910 and 118.6 in 1900. The value of farm property, including land, buildings, implements, and machinery, domestic animals, poultry, and bees, in 1910 was \$635,065,383, compared with \$323,515,977 in 1900. The average value of all property per farm was \$3397 in 1910, compared with \$1927 in 1900. The average value of all land per acre was \$20.24 in 1910, compared with \$10.08 in 1900. The farms operated by owners and managers in 1910 were 135,189, and those operated by tenants, 48,729. Of the farms operated wholly or in part by owners, those free from mortgage numbered 111,474, and those under mortgage, 21,182. The native white farmers numbered 134,155; foreign-born white, 1749; negro and other non-white, 48,114. Of the non-whites, all but 75 were negroes. Of these 74 were Indians and 1 was Chinese. The value of all kinds of domestic animals, poultry, and bees was \$74,891,538, compared with \$42,028,737 in 1900. The cattle numbered 859,067, valued at \$21,124,071; horses and

colts, 330,424, valued at \$34,857,610; mules, 60,022, valued at \$7,595,516; swine, 797,635, valued at \$4,165,630; sheep, 804,873, valued at \$3,300,026. Poultry of all kinds numbered 6,099,581, valued at \$3,395,962. The acreage, production, and value of the principal crops in 1910 and 1911 will be found in the following table:

	Acreage	Prod., bu.	Value
Corn1911	1,980,000	47,520,000	\$34,690,000
.....1910	1,960,000	49,980,000	32,487,000
Wheat1911	750,000	9,000,000	8,640,000
.....1910	748,000	9,574,000	9,287,000
Oats1911	194,000	3,880,000	2,095,000
.....1910	198,000	4,356,000	2,134,000
Rye1911	48,000	552,000	491,000
.....1910	50,000	675,000	540,000
Potatoes ..1911	95,000	4,275,000	4,104,000
.....1910	97,000	9,506,000	5,513,000
Hay1911	437,000	280,000	5,740,000
.....1910	475,000	565,000	8,192,000
Tobacco ..1911	760,000	128,000,000	12,288,000
.....1910	192,000	149,760,000	13,478,400

MINERAL PRODUCTION. A small amount of copper is produced in the State. The output in 1910 was 105,513 pounds of blister copper, as compared with 231,971 pounds in 1909.

The coal production of the State in 1910 was 6,507,997 short tons, with a value of \$5,877,486. This is the largest production in the history of coal mining in the State. There were produced in 1909 4,752,217 short tons. The coal produced has shown a steady increase in recent years. The strike in the States in the Mississippi Valley was the indirect cause of the remarkable increase, although little, if any, of the Virginia products was shipped to the west. The increased demand for coal in the State was due to the unusual demands upon the coal mines of West Virginia, which are customarily sent to the seaboard. They were diverted to more profitable markets in the West, which made an increased demand for Virginia coal for the seaboard.

The State ranks sixth in the production of iron ore. There were mined in 1910 903,377 long tons, valued at \$1,845,144, as compared with 837,847 long tons, valued at \$1,603,188, in 1909.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State include the Catawba Sanitarium, the Laurel Industrial School, the Negro Reformatory, the State Farm, the Virginia Penitentiary, the Virginia School for the Deaf and the Blind, the Virginia Home and Industrial School for Girls, and the Central, Eastern, Southwestern, and Western Insane Asylums. There are also a number of private institutions in the State which care for the feeble-minded. The total number of persons in the State institutions for the feeble-minded was 17,549, and in the private institutions, 18,476. The State Board of Charities during the year directed special attention toward investigating the problem of the feeble-minded, the indigent crippled, and deformed classes.

STATE OFFICERS. Governor, William H. Mann; Lieutenant-Governor, J. T. Ellyson; Secretary of the Commonwealth, B. O. James; First Auditor, S. P. Donohoe; Treasurer, A. W. Harman, Jr.; Superintendent of Instructions, J. D. Eggleston, Jr.; Attorney-General, Samuel W. Williams; Adjutant-General, W. W. Sale; Commissioner of Agriculture, George W. Komer; Commissioner of Insurance, Joseph Button—all Democrats.

JUDICIARY. Supreme Court of Appeals: Presi-

dent, James Keith; Justices, S. G. Whittle, John A. Buchanan, George M. Harrison, and Richard H. Cardwell; Clerk of the Court, H. Stewart Jones—all Democrats.

STATE LEGISLATURE, 1911. Democrats, Senate 35, House 90, joint ballot 125. Independents and Republicans, Senate 5, House 10, joint ballot 15. Democratic majority, Senate 30, House 80, joint ballot 110.

The representatives in Congress will be found in the article UNITED STATES, Congress.

VIRGIN ISLANDS. A presidency of the Leeward Islands (q. v.), covering 50 sq. miles, and having a population (census of 1911) of 5562. The capital of the group is Road Town (410 inhabitants in 1911). Cattle, sheep, and goats are raised; sugar and cotton are grown; a valuable copper mine is being worked. Revenue and expenditure (1910-11) £6091 and £5964 respectively; imports and exports, £8717 and £6684. The commissioner in 1911 was Leslie Jarvis.

VIRIBUS UNITIS. See BATTLESHIPS.

VISCER, HANNS. See EXPLORATION.

VITALISM. See BIOLOGY.

VITAL STATISTICS. The following figures were compiled from the public health reports of the United States Marine Hospital Service. These figures, while admittedly incomplete and often misleading, particularly in the case of foreign countries, where the number of deaths sometimes exceeds the number of cases reported, are, nevertheless, the best obtainable.

SMALLPOX. There was a total of 23,263 cases of smallpox in the United States, with 105 deaths. The States suffering most heavily were: California, 162 cases, 4 deaths; Colorado, 1465 cases, 1 death; Florida, 2231 cases, 6 deaths; Illinois, 368 cases; Indiana, 1014 cases, 3 deaths; Iowa, 849 cases, 5 deaths; Kansas, 1751 cases, 23 deaths; Louisiana, 432 cases, 3 deaths; Michigan, 719 cases, 6 deaths; Minnesota, 1049 cases, 2 deaths; Missouri, 527 cases, 3 deaths; Montana, 291 cases, 1 death; Nebraska, 320 cases; North Carolina, 3291 cases; North Dakota, 131 cases; New York, 151 cases, 1 death; Ohio, 583 cases, 1 death; Oklahoma, 1205 cases, 2 deaths; Oregon, 95 cases, 4 deaths; Pennsylvania, 140 cases, 1 death; South Dakota, 513 cases, 1 death; Tennessee, 573 cases, 4 deaths; Texas, 753 cases, 22 deaths; Utah, 1650 cases, 7 deaths; Vermont, 323 cases; Virginia, 892 cases; Washington, 906 cases, 2 deaths; Wisconsin, 316 cases.

Among foreign countries, considerable numbers of cases were reported from the following: Brazil, 253 cases, 2694 deaths; Canada, 789 cases, 4 deaths; Chile, 1350 cases, 43 deaths; China, 328 cases, 339 deaths; Great Britain, 328 cases, 15 deaths; India, 3032 cases, 1619 deaths; Indo-China, 671 cases, 144 deaths; Italy, 3395 cases, 1420 deaths; Philippine Islands, 235 cases; Russia, 2400 cases, 733 deaths.

YELLOW FEVER. No cases of yellow fever were reported in the United States during 1911. Other countries having cases are as follows: Barbados, 2 cases, 1 death; Brazil, 197 cases, 313 deaths; Ecuador, 313 cases, 138 deaths; Mexico, 45 cases, 20 deaths; Venezuela, 110 cases, 18 deaths.

CHOLERA. There were 22 cases of cholera in the United States, with 16 deaths, 18 of which were taken from incoming steamships in New York harbor, and detained in quarantine. There were many cases in Russia, Italy, and the East, distributed as follows: Arabia, 401 cases, 240

deaths; Austria-Hungary, 393 cases, 150 deaths; India, 672 cases, 2435 deaths; Indo-China, 232 cases, 145 deaths; Italy, 15,853 cases, 5949 deaths; Japan, 2793 cases, 1921 deaths; Java, 1323 cases, 1170 deaths; Madeira, 1711 cases, 585 deaths; Persia, 713 cases, 552 deaths; Philippine Islands, 424 cases, 326 deaths; Russia, 3696 cases, 1768 deaths; Siam, 1274 cases, 2341 deaths; Tunis, 4438 cases, 3845 deaths; Turkey in Europe, 4509 cases, 5635 deaths; Turkey in Asia, 4307 cases, 3352 deaths.

PLAGUE. Three cases and one death occurred in the United States, in California. In foreign countries the disease was distributed as follows: Arabia, 82 cases, 58 deaths; Brazil, 127 cases, 114 deaths; Chile, 97 cases, 52 deaths; China, number of cases not ascertainable, deaths reported as 68,000; Ecuador, 518 cases, 298 deaths; Egypt, 1610 cases, 1001 deaths; India, 881,187 cases, 734,111 deaths; Indo-China, 488 cases, 142 deaths; Japan (Formosa), 361 cases, 311 deaths; Java, 1209 cases, 462 deaths; Mauritius, 133 cases, 60 deaths; Persia, 125 cases, 98 deaths; Peru, 715 cases, 305 deaths; Russia, 170 cases, 231 deaths; Siam, 123 cases, 126 deaths; Turkey in Asia, 52 cases, 38 deaths.

BIRTH RATE. Many statistical reports during 1911 have dealt with the decline of the birth-rate in various countries. In New York State it was shown that the birth-rate was declining, particularly in the rural districts. For example, outside of the cities, in the month of March, 1911, there were 3745 deaths, and only 3275 births. During the same month, in cities of 10,000 or more inhabitants, there were 1398 births and 1237 deaths. As population becomes scantier, births and deaths approximate in number, until in third-class cities (those under 10,000) the births and deaths are exactly equal—45 each. It appears that the number of births varies directly with the proportion of foreign population. In New York City, where the foreign-born population is most numerous, the births exceeded the deaths by 4617; whereas, in the country, where the native population is largest, and where there are abundant opportunities for healthful living, in an estimated population of nearly 2,500,000, there were 470 more deaths than births.

In Prussia, on the contrary, the reverse appears to be the case. For the entire kingdom of Prussia there was a reduction in the ratio of fertility—that is, in the number of births from 1000 women capable of child-bearing, between the ages of 15 and 45; this ratio has declined from 174.60 in the quinquennium from 1876 to 1880 to 161.85 for 1896 to 1900, and 154.83 in the period from 1901 to 1905. In the cities, the ratio has declined from 160.64 to 129.12. In the rural districts, the ratio of fertility for 1876 to 1880 was 182.93, which figure was exceeded by a ratio of 183.06 for 1896 to 1900. The falling birth-rate in the cities occasions the marked diminution of the general fertility in Prussia. This phenomenon is especially notable in Berlin and the cities of the province of Brandenburg. The fertility ratio in Berlin sank from 149.21 in 1876 to 1880 to 88.78 in 1901 to 1905, a reduction of more than 40 per cent.

The results of a comparison of the census reports of Vienna for 1890, 1900, and 1910 were published. Vienna has now a population of over 2,000,000, of whom there died 34,000 in 1909, while the births numbered 43,854. The birth-rate of Vienna is constantly falling. In 1895,

it was 38 per 1000, in 1900, 31 per 1000, in 1905, 27, in 1910, 22. The figures for 1911 indicate a rate of 20. The death-rate also has a constant downward tendency. In 1895 it was 23 per 1000; in 1900, 20; and in 1910, 16.5. The actual decrease affected mostly the middle aged, while children up to 15 years have shown fairly constant figures. The large influx of persons in the prime of youth up to 30 is responsible for the increase in population, for the yearly increase was about 30,000, while the surplus over deaths was only 10,000.

British vital statistics tell the same story. During the third quarter of 1911 there were in England and Wales only 81,645 more births than deaths, as compared with 123,000 surplus in the third quarter of 1908, 124,054 in 1909, and 123,022 in 1910. A similar condition of affairs existed in Scotland, where the birth-rate for 1910 was 25.16 per 1000, the lowest figures ever recorded.

LONGEVITY. Some interesting tables showing the average length of life of the German people were published. From three mortality tables for the entire German people, the following average life duration was calculated: From 1871 to 1880, for men, 35.58 years; for women, 38.45. From 1881 to 1890, for men, 37.17; for women, 40.25. From 1891 to 1900, for men, 40.56; for women, 43.97. The average for men has risen five years in the last twenty years, that for women five and one-half years. Still, Germany is behind many other European countries. In Sweden, the average length of life is about ten years higher than in Germany; in Belgium and the Netherlands, about five years, and in France and England, about four years. The chief reason for this difference is believed to lie in the relatively high infant mortality of Germany.

VIVISECTION. The annual attempt on the part of the anti-vivisectionists to limit the use of animals for experimental purposes took the form in 1911 of a bill introduced into the New York legislature, which provided for the creation of a commission to inquire into the nature and practice of experimentation on living animals, and the state of the present laws regarding vivisection. This, the Bayne bill, was defeated decisively by a vote of 34 to 11, on the ground that adequate restrictions and abundant safeguards were already provided by existing laws.

VOCATIONAL EDUCATION. See EDUCATION.

VOLCANOES. The eruptions of Mount Etna in Sicily and Taal volcano in the Philippines during 1911 were the principal disturbances of the kind that have occurred since the period 1906-07, when activity was very general in the Mediterranean and Pacific volcanic regions. Mount Etna displayed unusual violence, compared with its other recent outbursts, and inflicted a great deal of damage upon the fertile, highly cultivated country that surrounds it. During the period of extreme activity, which lasted from September 10 to 17, it discharged immense quantities of lava and ash, laying waste many dwellings and cultivations, as well as causing important changes in the local topography. The largest lava stream flowed down the northeastern slope toward the Alcantara valley, and for a time threatened to engulf the towns of Castiglione and Francavilla, but did not actually reach that far. The stream, in its lower

part, was nearly one-third of a mile wide and about 50 feet thick. Several new craterlets were formed, and numerous earthquakes of the lighter sort accompanied the outbursts. The inhabitants of the devastated region secured their safety by timely flight, so that there was no serious loss of life.

Taal volcano, on the island of Luzon, about 60 kilometers south of Manila, broke its long period of quiescence on January 27, when it began erupting steam and ash. Three days later an outburst of explosive violence, the severest that has occurred in historic times, took place and laid waste an area estimated at 230 square kilometers, practically annihilating all life within that zone. Mud and ash were scattered over a much larger area. The number of fatalities was reported officially at 1335. The outburst on January 30 recalled the Mont Pelée disaster, as it was accompanied by a similar explosive rush of gases down the volcano's slopes, but owing to the fact that Taal lies in the middle of a lake the destructive effects of the blast were not so widespread. During the eruption a quantity of rock material estimated at from 70 to 80 million cubic meters was ejected.

A curious phenomenon which happened off the coast of Trinidad on November 4 gave rise to reports in the daily press that a new volcano had appeared in that vicinity. An island suddenly arose out of the sea and for a time sent a column of mud, water, and inflammable gases into the air. The disturbance, however, was not of deep-seated or igneous origin, but was caused undoubtedly by the release of hydro-carbon gases such as are included under the general name of natural gas, that were stored in the strata beneath the sea. The extensive asphalt accumulations and petroleum springs of Trinidad indicate the existence of these gases, which, under heavy rock pressure, may have forced their way to the surface to escape finally with explosive violence. The mud brought up from the sea bottom formed an island of two or three acres surface, rising 30 feet or more above water level. The flames that were reported as in evidence during a part of the disturbance may have been due to ignition of the gases by friction or electrical activity generated by their forceful issue.

VOLZ, W. See *EXPLORATION, Asia*.

VOORHEES, EDWARD BURNETT. An American agricultural chemist and educator, died June 6, 1911. He was born at Mine Brook, N. J., in 1856, and graduated from Rutgers College in 1881. He was assistant to the professor of chemistry in Wesleyan University in 1881-2, and from 1882 to the time of his death was connected with the New Jersey Agricultural Experiment station as chemist, assistant chemist, and director. From 1896 he was also director of the New Jersey Agricultural College Experiment station, and was professor of agriculture at Rutgers College from 1890, acting also as superintendent of the New Jersey Agricultural College farm. He was a member of many agricultural and chemical societies. In 1902 he received the Nichols research medal for the best paper containing results of chemical research reported to the American Chemical Society *Journal*; his subject was "Dentrification." He was the author of *First Principles of Agriculture* (1895), *Fertilizers* (1898), *Forage Crops* (1907), as well as many bulletins and magazine articles on agricultural topics. He lectured before farmers' in-

stitutes and other agricultural and horticultural societies in the Eastern States.

WAGES, MINIMUM. Alongside various movements for industrial betterment has developed a movement for the establishment of a legal minimum for the rates of wages in industries employing great numbers of women, children, or unskilled workers. It has come to be believed that the payment of starvation wages is a prolific cause of poverty and degeneracy. The advocates of a legal minimum wage hold that some industries are in fact parasitic and predatory, since the wages paid must be supplemented by public and private charity. Since 1894 the boards of arbitration in New Zealand have fixed wages in a variety of industries. In that country the boards of arbitration and arbitration courts have fixed the minimum wage at a fairly high level. They, however, grade the wages of each trade so as to permit the employment of a few low-grade workers at less than the general minimum. Experience there shows that while the establishment of such a minimum wage brings about some uniformity, nevertheless the degree of uniformity is not so great as was expected by the opponents of the measure. This system does, however, make wages rigid. On the other hand, the minimum-wage principle has banished sweating. In Australia minimum-wage boards may be established for each trade, representatives being nominated by employers and by employees, and appointed by the commissioner of labor, who also appoints a chairman. These boards fix not only the wages, but other conditions of employment. The Australian principle is that wages should be high enough to afford a living standard, otherwise the industry should be given up. Moreover, in Australia effort has been made to guarantee to the workers the benefits of the protective tariff, by enforcing a correlation between the wages of an industry and the rate of protection. For the minimum wage movement in the United States see *WOMEN IN INDUSTRY*.

GREAT BRITAIN. Under the Trade Boards act of 1909, which authorized the formation of special boards in the lace-making, box-making, chain-making, and tailoring industries, boards were organized in the first three of these three trades in 1910. Finally, late in 1911, a minimum-wage board was organized and established wages in the fourth of these sweated industries. The rates established in the men's clothing industry were a minimum of 4s. 10d. per week for women, and 25s. 6d. for men. The vast majority of women tailors had previously received less than this minimum. It was reported that about 25 per cent. of the women employed in shops earned less than 10d. per week, while those doing home work earned even less. The rates established for the tailoring trades were expected to affect several hundred thousand workers; the rates established in the earlier industries affected some 30,000 persons.

TRADE AGREEMENTS. The minimum-wage movement is usually thought of as the movement for the fixing of minimum rates of pay by some public authority. In addition to this legal minimum wage there goes on the establishment of minimum rates by means of agreements between employers and employees. Thus, in the coal-mining industry in Great Britain a

most stubborn and bitter fight was carried on over the fixing of minimum rates of pay. This was the chief cause of the strike in South Wales. (See **STRIKES AND LOCKOUTS**.) The miners pointed out that many of them are employed in abnormal situations, either on narrow veins or in other situations making impossible a normal output. A special conference in January decided to press for an average or minimum rate of wages in all districts. The mine owners refused to pay full wages for less than normal production. District conferences were held at many points, and finally a national joint conference of miners and owners was held in September. No settlement was reached, although the owners admitted that miners working in abnormal places had a real grievance. Meanwhile demand was put forward for a guaranteed minimum daily wage for all mine workers. The minimum demanded varied around 5s. (\$1.25) per day. At the miners' conference in October it was resolved "to take immediate steps to secure a minimum wage for all men and boys, without any reference to the working places being abnormal." A special conference in November decided to negotiate further before taking the action of a general national strike. A still further conference, December 20, reported that in nearly every district the owners were unwilling to concede the high minimum demanded. The conference then resolved to take a ballot of all full union members on the question whether a national strike to enforce the question of a guaranteed minimum wage should be ordered. If favored by the requisite two-thirds majority a strike seemed probable about March 1. Similarly the strike of the seamen and dockmen throughout Great Britain in the summer of 1911 was due to the demand for the establishment of a minimum rate of pay. (See **STRIKES**.) This strike was successful and resulted in the establishment of a fair minimum rate of pay for more than 100,000 men.

OTHER METHODS. The railway strikes in France in 1910 were due in part to the demand by the employees for a minimum wage of \$1 per day. Such a rate was established early in 1911 through the intervention of the government. The establishment of minimum wages by means of trade agreements is possible only where the workers are well organized. Nothing could more clearly demonstrate the value of organization among the unskilled workers than the successful termination of the great strikes of seamen and dockmen in the summer of 1911. In July the Independent Labor party of Great Britain opened a campaign for 30s. per week for all adult workers, accompanied by a reduction of working hours. This was favored by a conference at Bradford in July, attended by 400 delegates, representing about 200 socialist societies and trade unions in Yorkshire. Thus we see a variety of methods of accomplishing the minimum wage: direct establishment by a government board; trade agreements between organized workers and employers; trade agreements brought about through the intervention of a governmental agency; and, finally, the political pressure of labor parties.

WAGES AND COST OF LIVING. See **PRICES**.

WAGNER, RICHARD. See **LITERATURE, ENGLISH AND AMERICAN, General Biography**.

WALKER, Sir SAMUEL. An Irish jurist, lord

chancellor of Ireland, died August 13, 1911. He was born in Goreport, Ireland, in 1832. He was educated in Trinity College, Dublin. He was called to the bar in 1855 and at once entered upon a career of uninterrupted success. In 1883 he was appointed solicitor-general for Ireland, and two years later was advanced to the office of attorney-general. When the split occurred in the Liberal party after the introduction of the Home Rule bill, he took a stand with the Liberal Home Rulers. With the return of the Gladstone party to power in 1892 he was appointed lord chancellor of Ireland. On the return to power of the Unionist government in 1895 he was made a lord justice of appeal, an office which he continued to hold until 1905, when he became for a second time lord chancellor. He was created a baronet in 1906.

WALLA WALLA (WASH.). See **MUNICIPAL GOVERNMENT**.

WALLIS ARCHIPELAGO, THE. A dependency of New Caledonia (q. v.).

WARD, ELIZABETH STUART (PHELPS). An American author and lecturer, died January 28, 1911. She was born in Boston in 1844, the daughter of Rev. Austin Phelps, and granddaughter through her mother of Rev. Moses Stuart, who was one of the most eminent members of the faculty of Andover Theological Seminary when that institution was at the height of its influence. Her father was also a professor at Andover and she lived with him in that town for many years. She began to write when she was thirteen years of age and when she was twenty-four wrote the book which first brought her into prominence, *The Gates Ajar*. This went through twenty editions within a year of its publication. At this time and for many years thereafter she devoted herself to writing and to the social betterment of the people of Andover. *The Gates Ajar* was followed by two others, *Beyond the Gates* and *The Gates Between*. In 1898 she was married to Herbert D. Ward, who was at that time professor of Latin and Greek at Talladega College. After his marriage, however, he also adopted a literary career. Previous to the publication of *The Gates Ajar* Mrs. Ward had published the Gipsy series in four volumes. In 1869 appeared *Men, Women and Ghosts*, and this was followed by a succession of novels, of which the best known are *Hedged In* (1870); *The Story of Avis* (1877); *Old Maids and Burglars in Paradise* (1885); *Madonna of the Tubs* (1886); *A Singular Life* (1894); *Within the Gates* (1901); *Walled In* (1907); *Jonathan and David* (1909); *The Oath of Allegiance* (1909), and *Comrade, 1911*. She also wrote a volume of reminiscences dealing chiefly with her early life at Andover. Of late years she wrote many short stories which appeared in the leading magazines.

WARD, Mrs. HUMPHRY. See **LITERATURE, ENGLISH AND AMERICAN, Fiction**.

WARDWELL, WILLIAM THOMAS. An American capitalist and philanthropist, died January, 1911. He was born at Bristol, R. I., in 1827. He was educated as a chemist and began refining oil in Long Island. The company which he founded was successful until the formation of the Standard Oil Company, when it was taken over and Mr. Wardwell became associated with that company. He was the originator of the employees' pension system of that corpora-

tion. He took great interest in public affairs, especially in the prohibition of liquor. In 1886 he was Prohibition candidate for mayor of New York City. He was associated with the Red Cross Hospital Association from the time of its founding. In 1897, when the association was facing ruin, he came to the rescue with a gift. He later contributed \$100,000 toward a new building for the association and up to the time of his death made up the monthly deficit of the hospital. At the time of the Spanish War he was appointed a member of the commission to establish the National Red Cross Committee. He was at one time the treasurer of the Standard Oil Company. He was Prohibition candidate for governor of New York in 1900.

WARE, EUGENE F. An American public official and poet, died July 2, 1911. He was born in Hartford, Conn., in 1841. His parents early removed to Iowa and he was educated in the public schools of Burlington. He served throughout the Civil War and was mustered out as captain in the Seventh Iowa Cavalry. He was admitted to the bar in 1871. From 1879 to 1884 he was a member of the Kansas Senate. From May 10, 1902 to January 1, 1905, he was United States commissioner of pensions. On his resignation from this office he again practiced law in Kansas City, Kan. Mr. Ware was well known as a poet under the name of "Ironquill." For years he contributed his verses to newspapers, principally in Kansas. These verses, published in a volume entitled *The Rhymes of Ironquill*, reached thirteen editions. He published also other books of verse. He was also the author of *The Rise and Fall of the Saloon* (1900), *The Lyon Campaign and History of the First Iowa Infantry* (1907), *The Indian Campaign of 1864* (1908), *Ithuriel*, (1909), and *From Court to Court* (1909). He translated *The Roman Water Law* from the Latin of Justinian and was a contributor to legal and literary publications.

WARNER, JAMES D. An American mathematician and engineer, died March 12, 1911. He was born in Saratoga county, N. Y., in 1846. In 1862 he moved to New York City and became active in Republican politics. He was one of the original surveyors for the Erie Railroad and was the leading engineer in the construction of the Kansas-Pacific Railroad. He was for many years one of the best known engineers of the United States. He was a member of several learned societies, both in the United States and in foreign countries.

WASDIN, EUGENE. An American surgeon, died November 16, 1911. He was born in 1869. He became a well-known authority in yellow fever and was decorated by the king of Italy in recognition of his researches in suppression of that disease in Italy. As a surgeon of the United States Marine Hospital Service, he was stationed at Buffalo when President McKinley was shot in that city in 1901. He was one of the surgeons who operated on President McKinley and attended him during his illness.

WASHINGTON. POPULATION. The Thirtieth Census showed a population in 1910 of 1,141,990, compared with 508,103 in 1900, an increase of 120.4 per cent. in the decade. This is the largest percentage of increase shown in any State in the period. The principal cities with their populations in 1910 and 1900 are given below (the figures in parentheses are for 1900): Seattle, 237,104 (80,671); Spokane, 104,462 (36,-

848); Tacoma, 83,743 (37,714); Everett, 24,814 (7838); Bellingham, 24,298 (11,062); Walla Walla, 19,364 (10,049); North Yakima, 14,082 (3154); Aberdeen, 13,660 (3747).

AGRICULTURE. The Thirteenth Census included statistics of agriculture. These are of date of April 15, 1910. On that date the number of farms in the State was 56,192, compared with 33,202 in 1900. The land in farms was 11,712,235 acres, compared with 8,499,297 in 1900. The improved land in farms was 6,373,311 acres, compared with 3,465,960 in 1900. The average acreage per farm was 208.4, compared with 256 in 1900. The value of all farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$637,543,411, compared with \$144,040,547 in 1900, an increase of 342.6 per cent. in the decade. The average value of all property per farm was \$11,346, compared with \$4338 in 1900. The average value of land per acre was \$44.13, compared with \$11.68 in 1900. The farms operated by owners and managers numbered 48,466 and those operated by tenants, 7726. Of the farms operated wholly or in part by owners, those free from mortgage numbered 309,796 and those under mortgage, 16,026. The native white farmers numbered 37,770; foreign-born, 17,297; negro and other non-white, 1125. Of the non-white farmers 316 were Japanese, 77 negroes, 59 Chinese, and 673 Indians. The domestic animals of all kinds in 1910 were valued at \$48,865,110 in 1910, compared with \$22,159,207 in 1900. The cattle numbered 402,120, valued at \$12,193,465; horses and colts, 280,572, valued at \$29,680,849; mules 12,185, valued at \$1,776,297; swine 266,135, valued at \$1,674,927; sheep 475,555, valued at \$1,931,170. The poultry of all kinds numbered 2,272,775, valued at \$1,367,440. The acreage, production, and value of the principal crops in 1910 and 1911 will be found in the following table:

		Acreage	Prod., bu.	Value
Corn	1911	30,000	855,000	\$675,000
	1910	28,000	784,000	588,000
Wheat	1911	2,230,000	50,661,000	35,969,000
	1910	2,101,000	35,571,000	27,746,000
Oats	1911	281,000	14,528,000	6,538,000
	1910	275,000	11,770,000	5,650,000
Rye	1911	8,000	176,000	141,000

a Tons.				

MINERAL PRODUCTION. The State produces a considerable amount of gold and silver. The gold production in 1910 was 38,126 fine ounces, valued at \$788,145. In 1911 it was 24,407 fine ounces, valued at \$504,537. The silver production in 1910 was 205,345 fine ounces, valued at \$110,886. In 1911 it was 142,196 fine ounces, valued at \$78,209. The State produces copper in small quantities. In 1910 the output was 65,021 pounds, as compared with 120,611 pounds in 1909.

EDUCATION. The whole number of children of school age in the State on May 1, 1911, was 276,244. The total enrollment in the public schools was 220,461. The average daily attendance was 163,021. The teachers employed numbered 7589, of whom 6111 were female and 1478 male. The average monthly salary for

male teachers was \$85.69, and for female teachers, \$66.25.

FINANCE. The report of the State treasurer for the year ended December 31, 1911, showed a balance on hand January 1, 1911, of \$936,251. The receipts during the year were \$7,974,096, and the disbursements, \$7,830,869, leaving a balance at the end of the year of \$1,129,478. The assessed valuation of personal and real property in 1911 was \$812,563,222. The assessment of steam railways was \$132,458,414, and of electric railways, \$19,673,082.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State with population in 1911 are as follows: Western Washington Hospital for the Insane, Steilacoom, 1454; Eastern Washington Hospital for the Insane, Medical Lake, 807; Institution for the Feeble-Minded, Medical Lake, 158; State Soldiers' Home, Orting, 670; Washington Veterans' Home, Port Orchard, 187; Soldiers' Colony, 666; State School for the Deaf, Vancouver, 109; State School for the Blind, Vancouver, 39; State Penitentiary, Walla Walla, 901; State Training School, Chehalis, 572; and State Reformatory, Monroe, 288.

The State institutions are under the management of the State Board of Control, composed of three members. At the 1911 session of the legislature a bill was introduced providing for the better management of both State and private charitable and correctional institutions in which a plan of government modeled after the Illinois State Board providing for both fiscal and expert management was presented. While this bill failed of passage, the way was paved for a successful presentation of the matter later. This State is well in the front not so much in the State institutions already provided as in the laws enacted seeking to prevent poverty and the increase of institutions for the care of the poor or unfortunate. The Employers' Liability act is proving efficient and will tend to decrease deaths by accident and the number of dependants from this cause. The children of the State are well looked after through the juvenile courts, the Washington Children's Home Society, and the Orthopedic Hospital, the latter two being private charities.

POLITICS AND GOVERNMENT

The legislature met in 1911 and the most important measures enacted will be found noted in the paragraph *Legislation*, below. On January 17, the legislature elected Miles Poindexter United States senator, to succeed Senator Piles. Senator Poindexter received the nomination at the primaries in 1910. He is identified with the Progressive wing of the Republican party. The chief political interests in the State in 1911 centred about the elections held in Seattle and Tacoma under the provisions of the recall.

In December, 1910, signatures of 9626 persons were obtained to a petition calling for a recall of the mayor of Seattle, Hiram C. Gill. In accordance with the provisions of the law providing for a recall, the city council ordered a special election to be held in February. The charges made against the mayor were incompetence and unfitness; abuse of the appointive power by selecting, for political and personal reasons, men unfit for office; failure, refusal, and neglect to enforce the criminal laws of the

city; permitting the city to become a home and refuge for criminal classes; failure to enforce impartially the laws and ordinances; and that his continuance in office was a menace to the business enterprises and moral welfare of the city. Shortly before the council had taken this action the mayor applied to Judge Albertson of the Superior Court for King county for an injunction restraining the city officials from proceeding with the recall election. He alleged that signatures to the petition had been fraudulently obtained and he charged also that there were defects in the law providing for the recall and technical irregularities of various kinds. Judge Albertson refused to grant the injunction. Supporters of Mayor Gill then applied to Judge Hanford of the United States Circuit Court in the name of a citizen, a resident of Illinois, alleged to own property and pay taxes in Seattle, claiming that his taxes would be increased by reason of the expense of a recall election, and that as the election was illegal, he was entitled to the protection of the court. Judge Hanford granted an injunction, not restraining the city from holding the election, but restraining the city comptroller from paying out any money or from issuing any warrants on account of election expenses. The corporation counsel and the attorney for the Public Welfare League immediately applied to Judge Gilbert of the United States Circuit Court of Appeals at Portland, Ore., for a writ overruling Judge Hanford's decision. This Judge Gilbert issued, but required the city to file a bond of \$15,000 and set a date for a further hearing. Two days later Mayor Gill's attorneys appeared before Judge Hanford and consented that the case should be dismissed, thus leaving the city free to proceed with the election.

In the election held on February 11, 1911, Mayor Gill was displaced by George W. Dilling. The vote for Mr. Dilling was 31,919, as against 25,705 for Mr. Gill. The total majority for a change in the city government was 10,912. A few months later an attempt was made to recall Mayor Dilling; petitions were filed on August 17 and 24 with an aggregate of 9048 names. The women's vote was responsible for Mr. Gill's recall and with the increased electorate due to this vote, the names on the Dilling recall petition fell below the percentage required to make it effective. An attempt was made at the same time to recall three of the councilmen.

Following the recall Seattle held a general election on March 7. At this time the charter amendment, adopted the previous year, establishing the non-partisan primary and abolishing the ward system of representation, became effective. The council of eighteen, fourteen from as many wards and four at large, was reduced to nine at large. All members of the old council and fifty additional persons were candidates for the new council. The sixty-eight candidates were sifted by a large citizens' committee initiated by the Municipal League, and guided by the committee's report the voters were enabled to eliminate the undesirable aspirants. The new council proved an improvement over the old.

The provision for the recall of the mayor was put into effect also in Tacoma, where the incumbent of that office was charged with incompetency. As great engineering contracts, includ-

ing the municipal hydro-electric power plant, costing \$1,700,000, were to be undertaken, it was felt by the citizens that the officer who should have general charge of this work should be a stronger man than the mayor had proved himself to be, and an election was held on April 4 for the nomination of candidates. William W. Seymour received 1300 more votes than were cast for the mayor for reelection, but these were not sufficient to give him a majority over all the candidates. Another election was held several weeks later in which Mr. Seymour received a sufficient number of votes for nomination.

The anticipated commercial importance of the Panama Canal to Washington was shown by the fact that six Atlantic steamship companies conducted negotiations for docking facilities at Tacoma and Seattle. Movements were on foot to provide municipal ownership of terminals for all steamships not having direct railway connections. Tacoma leased from the State a large harbor area and acquired a large area of tide lands, through the centre of which channels will be dredged. Two large bridges are being built by the city across the existing waterways. Seattle with King county was the first to take advantage of the new port districting law, and in September created the separate municipality known as the Port of Seattle with Gen. H. M. Chittenden (U. S. A. Engineers, retired), C. E. Remsburg, and Robert Bridges as commissioners without compensation.

A number of the smaller cities of 20,000 or less availed themselves of a new State law and adopted short ballot charters.

The Public Service Commission rendered a far-reaching decision in the case of the Independent Telephone Company against the city of Seattle. The telephone company, ignoring its franchise agreement with the city, applied for an advance in its rates. The commission considered the showing of the company sufficient and, in the exercise of the police powers of the State, granted the increase. The case was carried to the Supreme Court.

Architects were selected in national competition and their plans for a \$6,000,000 capitol layout, on the unit system, were adopted by the State. The first unit, Temple of Justice, will be erected in 1912.

LEGISLATION. The important measures enacted at the legislative session of 1911 include the following: Cities of the first class are allowed to provide in their charters for the recall of elective officers, and the initiative and referendum. Cities with such charter powers may provide for nominations for such recall elections by certificate of nomination signed by not less than five per cent. of the votes cast for the incumbent against whom the recall is directed. A constitutional amendment for the recall of all elective officers, except judges of courts of record, is to be submitted to vote at the general election of 1912. The hours of employment for women in mechanical, mercantile, or industrial establishments are limited to eight hours a day except in the harvest and canning industries. Proposed amendments to the constitution for the initiative and referendum are to be submitted to public vote at the election in November, 1912. Provision was made for the enactment of an insurance code systematizing and safeguarding the insurance

business of the State. Provision was made for the compensation for injury by the creation of a commission of three to be appointed to pass on all claims of this character. This commission is to award damages according to schedule of compensation fixed in the act. All defenses, except that of intentional injury of the workman himself, are abrogated. The funds are provided by assessments levied upon the different industries, based upon the payroll for the previous years. A measure was enacted providing for the nomination and election of judges of courts of record, original and appellate, on a non-partisan judiciary ticket. The smaller cities of the State are authorized to govern themselves under the commission plan. A public service commission of three persons was established, with general supervisory and regulating power over all service companies. Provision was made for the protection of forests from fires.

STATE OFFICERS. Governor, M. E. Hay; Secretary of State, I. M. Howell; Treasurer, John G. Lewis; Auditor, C. W. Clausen; Superintendent of Education, Henry B. Dewey; Attorney-General, V. W. Tanner; Commissioner of Public Lands, E. W. Ross—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, R. O. Dunbar; Associate Justices, O. G. Ellis, H. D. Crow, M. A. Fullerton, W. Mount, M. F. Gose, S. J. Chadwick, George E. Morris, and Emmett N. Parker—all Republicans, except Chadwick; Clerk, C. S. Reinhart.

STATE LEGISLATURE, 1911. Republicans, Senate, 38; House, 84; joint ballot, 122; Democrats, Senate, 4; House, 12; joint ballot, 16. Republican majority, Senate, 34; House, 72; joint ballot, 106.

The representatives in Congress will be found in the article UNITED STATES, section Congress.

WASHINGTON, BOOKER T. See LITERATURE, ENGLISH AND AMERICAN, *General Biography*.

WASHINGTON, UNIVERSITY OF. An institution of higher learning at Seattle, Wash., founded in 1862. The students enrolled in the various departments of the university in 1911-12 numbered 2427. There were 128 members of the faculty. During the year Edgar B. Sheridan was appointed to succeed Merle Thorpe as head of the department of journalism. Irving M. Glen was appointed to succeed C. O. Kimball as head of the department of music, and Arthur Sewall Haggett, Ph. D., was appointed to succeed Arthur R. Priest as dean of the college of arts and sciences. Eighteen additional instructors were appointed in June, 1911. Among the benefactions received during the year was the endowment of \$30,000 to establish a bureau of child welfare. Two new courses were added, a course in library training and a course in music leading to the degree of bachelor of music. Provision was also made for graduate courses leading to the doctor's degree. Graduate work is regularly offered in only one department for the first year. The productive funds of the university amount to about \$3,000,000. There was appropriated for its support by the State in 1911-12 \$400,000. The library contains about 45,000 volumes. President, 1911, Thomas F. Kane.

WASHINGTON UNIVERSITY. An institution of higher learning at St. Louis, Mo., founded in 1853. The students in all depart-

THE L. C. SMITH BUILDING, SEATTLE, WASHINGTON
A FORTY-TWO STORY SKYSCRAPER, GAGGIN AND GAGGIN ARCHITECTS

ments in the year 1911-12 numbered 1173. Of these 517 were in the college; 191 in the schools of engineering and architecture; 36 in the school of social economy; 78 in the law school; 108 in the medical school; 89 in the dental school; and 154 in the school of fine arts. The faculty numbered 199. Noteworthy changes in the faculty during the collegiate year were the appointment of Monsieur Charles Abella of Paris as professor of design in the school of architecture; and the appointment of full-time professors in the medical school as the result of the entire reorganization of that school. An affiliation has been made with the Barnes Hospital and the St. Louis Children's Hospital which permits these institutions to be used for teaching purposes. The productive funds of the university amount to \$7,715,334. The income from the productive funds is \$311,855, and the entire total income \$532,881. The library contains about 110,000 volumes. Chancellor, 1911, David F. Houston.

WATER COLOR SOCIETY. See PAINTING.

WATER POLLUTION. See SANITATION.

WATER POWER. The tendency in large hydro-electric stations is to employ as large units as is possible. The Pacific Coast Power Company during the year was installing Francis turbines of 20,400 horsepower rating, and units of similar size were being provided for other large hydro-electric plants. In the main, however, no radical developments in hydro-electric turbines and water wheels were reported during the year, but progress was being made in details of design, and in attempts to secure better governing.

WATER PURIFICATION. Water disinfection by means of calcium hypochlorite (bleaching powder or chloride of lime) has been adopted by many American cities within the past three years or so, either as an emergency measure at a time of a typhoid outbreak attributed to unusual water pollution or as a more permanent, though perhaps still temporary measure, pending the building of slow sand or mechanical filters or the provision of a supply from a new source. In a number of instances disinfection is used to supplement filtration works.

Other means of disinfection, the use of which is thus far confined chiefly to Europe, are ozone and ultra-violet rays. The use of the latter has thus far scarcely gone beyond the experimental stage, although some small plants on a working scale were reported in practical, everyday use in 1911. Ozone treatment, older by a few years, is in wider use and on a larger scale than ultra-violet rays, but it can scarcely be said to be in general commercial use. An ozone plant with a daily capacity of 13,000,000 gallons was reported in 1911 as having been put in use to treat the water supply of St. Petersburg, Russia. As at most, if not all, ozone plants, it is necessary to pre-filter the water. For this purpose 38 mechanical filters, using sulphate of alumina as a coagulant, are employed. The drawback to the use of ozone is its own high cost and the fact that the water must have preliminary treatment, also at considerable expense, unless it is already remarkably free from organic matter. At some of the plants where ozone has been used the water to

which the ozone was applied was already nearly free from bacteria, thus making further treatment approach the nature of a "counsel of perfection."

A new slow sand filtration plant was about ready for use at Toronto, Ont., at the close of 1911, while on November 21, 1911, Philadelphia, Pa., was wholly supplied with filtered water for the first time. The combined daily capacity of the five plants at Philadelphia is 385,000,000 gallons. The water is treated by slow sand filtration, but most of it pre-filtered at a rapid rate before going to main filters.

Two small sand filtration plants have recently been installed at Gloucester, Mass., for the unique purpose of purifying water used in curing fish by the great fish companies in the city. This came about through an investigation to determine the cause of the "reddening" of salt-cured fish. It was concluded that the cause was *Oidium morrhue*, a moldlike fungus, which gained access to and infected the fish through the use of polluted harbor water for washing the fish. (See *Bulletin 153*, Bureau of Chemistry, United States Department of Agriculture, for an account of this and other phases of the fish industry, and *Journal of the New England Water Works Association* (Boston, 1911) for a description of the filters.) The same publication contains a suggestive paper, entitled: "Has the Time Come for Double Municipal Water Supplies? One Naturally Pure for Drinking and Cooking; the Other Denaturated, for all other Purposes," by Prof. William T. Sedgwick and H. P. Letton.

WATER SUPPLY. See AQUEDUCTS.

WATERS, RUSSELL JUDSON. An American banker, formerly representative to Congress from California, died September 26, 1911. He was born in Halifax, Vt., in 1843, and was educated at the Franklin Institute. He learned the trade of machinist, and taught school for several years. He was admitted to the bar in 1868 and practiced in Chicago until 1886, when he removed to California, where he founded the city of Redlands. In 1894 he removed to Los Angeles and was elected to the Fifty-sixth Congress in 1899 as a Republican. He was president of several banking institutions and was interested in many financial enterprises in California. He was the author of *Lyric Echoes* (poems) and *El Estranjero*.

WATSON, CLARENCE WAYLAND. United States senator (Democrat) from West Virginia. He was born in Fairmont, W. Va., in 1864, and was educated in the public schools. While still a youth he engaged in the coal mining industry, in which his father, the late James Otis Watson, was the pioneer in the State. In July, 1908, he was a delegate from the first district of West Virginia to the Democratic national convention. He was elected United States senator by the legislature on January 25, 1911, to fill the unexpired term of Senator Elkins, deceased. His term of service expires in 1913.

WAYWARD CHILDREN. See JUVENILE COURTS.

WEBB, ALEXANDER STEWART. An American soldier and educator, died February 12, 1911. He was born in New York City in 1835 and graduated from the United States Military Academy in 1855. He was assigned to the artillery arm of the service and on the outbreak of the Civil War was appointed captain of the 11th infantry. He was later made major

of the first Rhode Island infantry and served as assistant chief of artillery in the Army of the Potomac and inspector-general of the fifth army corps. In 1863 he was promoted to brigadier-general of the United States Volunteers. For the year following he commanded the second division of the second army corps. He served with distinction at Gettysburg and was wounded in that battle. He also took part in the battles of the Wilderness. He was severely wounded at Spottsylvania in 1864. He was awarded the congressional medal of honor for distinguished personal gallantry in the battle of Gettysburg in 1863. He was assigned major-general of United States Volunteers by President Lincoln. He was chief of staff of the Army of the Potomac at the time of the surrender of General Lee, and until May, 1866. He was lieutenant-colonel of the 44th infantry and afterwards served in the same grade with the 5th infantry. In 1869 he was appointed to the brevet rank of major-general in the volunteer and regular army. In the same year he was appointed by President Grant major-general in command of the first military district, State of Virginia. He was discharged at his own request in December, 1870. In 1869 he was chosen president of the College of the City of New York and this position he filled for over thirty-three years. In 1903 he was retired and pensioned by the State law. During the period of his administration the College of the City of New York was evolved from an institution of secondary importance into one of the most efficient educational factors in the country. He wrote on the Civil War and other subjects, and his most important literary production was *The Peninsula—McClellan's Campaign of 1862*.

WEEKS BILL. See FORESTRY.

WEI-HAI-WEI. A territory about forty miles east of Chifu on the Shantung promontory, leased to Great Britain by China by a convention signed at Peking, July 1, 1898. With the town and harbor Great Britain acquired also the island of Liu-Kung and all other islands and waters in the bay, together with a strip of territory ten miles wide along the coast. The area is 285 miles and the population about 150,000. The sphere of British (military) influence covers 1500 sq. miles. The territory is administered by a commissioner (1911, Sir J. H. Stewart Lockhart), under the Colonial Office, residing at Port Edward on the mainland.

WELFARE WORKS. See UNITED STATES STEEL CORPORATION.

WELLS, CATHERINE BOOTT (Mrs. KATE GANNETT WELLS). An American author, died December 13, 1911. She was born in England in 1838. In 1863 she married Samuel Wells. Her father was the Rev. Ezra Stiles Gannett, who was for many years pastor of the Arlington Street Church in Boston. She was a contributor to newspapers and gave much study to normal methods of instruction in Sunday school manuals of ethics. She served three terms of eight years each as a member of the Massachusetts State Board of Education. Among her published works are: *In the Clearings*, *Miss Curtis*, *Two Modern Women*, *Little Dick's Son*, and a volume of essays, entitled *About People*.

WELLS, DAVID COLLIN. An American economist and educator, died June 12, 1911. He was born at Fayetteville, N. Y., in 1858 and graduated from Yale College in 1880. He studied at Union Theological Seminary and at Andover

Theological Seminary, graduating from the latter institution in 1885. In 1886-7 he studied in Germany. From 1887 to 1890 he was instructor in Phillips Academy, Andover, Mass. He was appointed professor of history and political science at Bowdoin College in 1890, serving until 1893. From that year to the time of his death he was professor of sociology at Dartmouth College. He was a member of several American and foreign learned societies and was advisory editor of the *American Journal of Sociology*.

WELLS, H. G. See LITERATURE, ENGLISH AND AMERICAN, *Fiction*.

WELLESLEY COLLEGE. An institution for the higher education of women at Wellesley, Mass., founded in 1875. The students enrolled in all departments of the college in 1911-12 numbered 1418. The teaching force numbered 122. The most important event in the history of the college during the year was the elevation of the associate professor of mathematics, Miss Ellen F. Pendleton, to the presidency to succeed President Hazard, who resigned in 1910. During the year \$52,500 was received as gifts. Of this amount \$45,000 was from the bequest of John Stewart Kennedy. The library contains about 70,000 volumes.

WERNER'S THEORY. See CHEMISTRY.

WERTHEIMER, CHARLES. An English art dealer and connoisseur, died April 25, 1911. He was born in London, where his father was an art dealer. From early youth he traveled over the continent of Europe in search of rare objects of art. His transactions were always on a large scale. He bought only the finest things in the way of pictures, jewels, and works of art. Among the notable objects purchased by him was the Gabbitas Biberon of rock crystal, for which he paid over \$75,000 in 1905. He also purchased Hoppner's "Lady Louisa Manners" in 1901. For this he paid over \$90,000, which at that time surpassed all known records for a picture. He was perhaps the best known art dealer in Europe at the time of his death.

WESLEYAN METHODIST CONNECTION OF AMERICA. A Protestant evangelical denomination of Methodist principles, which was founded in 1843 by members of the Methodist Episcopal Church, who strongly opposed the institution of slavery. The denomination numbered in 1911 about 19,000 communicants, 605 churches, and 598 ministers. The church property is valued approximately at \$650,000. Among the educational institutions maintained are Houghton Seminary at Houghton, New York, Miltonvale College, at Miltonvale, Kansas, and Central College at Central, S. C. The official paper of the denomination is the *Wesleyan Methodist*, published at Syracuse, N. Y. The highest authority of the church is the Quadrennial General Conference, which met in October, 1911, at Fairmount, Ind. This session changed the month of the Quadrennial meeting from October to June. The denomination has two important missionary fields, one in Sierra Leone, West Africa, and one in India.

WESLEYAN UNIVERSITY. An institution of higher learning at Middletown, Conn., founded in 1831. The number of students enrolled in 1911-12 was 390. The faculty numbered 97. There were no notable changes in the faculty during the year and no noteworthy benefactions were received. The amount of pro-

ductive funds was \$1,637,034 and the income was \$156,500. The library contains about 85,000 volumes. President, 1911, William A. Shanklin, D. D.

WEST, CLIFFORD HARDY. A rear-admiral, retired, of the United States navy, died November 2, 1911. He was born in Brooklyn in 1846 and graduated from the United States Naval Academy in 1867. In the following year he was made ensign, was promoted to be master in 1870, lieutenant, 1871, lieutenant-commander, 1888, commander, 1896, captain, 1901, and rear-admiral, 1902. In the same year he was retired. He served on many duties and stations, and was on board the steam sloop *Wyoming* in the West Indies during complications with Spain in regard to the steamers *Virginias* and *Edgar Stuart*. He was lieutenant and executive officer on board the *Alliance* during the search for Lieutenant DeLong on the coasts of Greenland, Iceland, and Spitzbergen. At the outbreak of the Spanish-American War he was chief of staff of Admiral Sicard on the flagship, *New York*. During this war he commanded the *Princeton*. He also took part in operations against the insurgents in the Philippines.

WESTERN AUSTRALIA. A state of the Commonwealth of Australia. The area is stated at 975,920 sq. miles. Final returns of the census of April 3, 1911, showed a population (exclusive of aborigines) of 282,114, as compared with 184,124 in 1901. The percentage of increase was 53.22, as compared with 18.05 for the commonwealth. The capital is Perth, with 84,580 inhabitants in 1911 (preliminary returns). Executive authority rests with a governor, who is appointed by the British crown and is assisted by a responsible ministry. The legislative power devolves upon a parliament of two elective houses, the Legislative Council and the Legislative Assembly. Governor in 1911, Sir Gerald Strickland; premier, John Scadden. See AUSTRALIA.

A violent contest arose over the Redistribution of Seats bill when it was debated in parliament. The Labor party employed obstructive measures and six of them were ejected from the house. Finally, all the Labor members withdrew. The election of October, 1911, brought a Socialist and Labor ministry into power, with Mr. John Scadden, premier.

WESTFALEN. See BATTLESHIPS.

WEST VIRGINIA. POPULATION. The Thirteenth Census showed a population in 1910 of 1,221,119, compared with 958,800 in 1900, an increase of 27.4 per cent. in the decade. The principal cities with their populations in 1910 and 1900 are given below (the figures in parentheses are for 1900): Wheeling, 41,641 (38,878); Huntington, 31,161 (11,923); Charleston, 22,996 (11,090); Parkersburg, 17,842 (11,703); Martinsburg, 10,698 (7564); Bluefield, 11,188 (4644).

AGRICULTURE. The Thirteenth Census included statistics of agriculture. These are of date of April 15, 1910. At that date there were in the State 96,685 farms, compared with 92,874 in 1900. The land in farms amounted to 10,026,442 acres, a decrease of 628,071 from the amount in farms in 1900. The improved land in farms amounted to 5,521,747. The average acreage per farm was 103.7. The value of all farm property, including land, buildings, implements and machinery, domestic animals,

poultry, and bees, was \$314,738,540, as compared with a value of \$203,907,349 in 1900. The average value of all property per farm was \$3255, and the average value of land per acre was \$20.65, as compared with \$12.60 in 1900. Of the 96,685 farms in the State 76,850 were operated by owners and managers; and 19,835 were operated by tenants. Of the former there were 66,093 farms free of mortgage, while 9525 were mortgaged. Of those operating and managing farms, 95,138 were native whites, 839 were foreign-born whites, and 708 were negroes and other non-whites. The domestic animals, poultry, and bees were valued in 1910 at \$43,336,073, as compared with a value in 1900 of \$30,571,259. The cattle numbered 620,288, valued at \$15,860,764; horses and colts, 179,991, valued at \$18,583,381; mules and mule colts, 11,717, valued at \$1,339,760; swine, 323,188, valued at \$2,087,392; sheep and lambs, 910,360, valued at \$3,400,901. The poultry of various kinds numbered 3,310,155, valued at \$1,628,700. The acreage, production, and value of the principal crops will be found in the table below:

		Acreage	Prod., bu.	Value
Corn	1911	707,000	18,700,000	\$13,991,000
	1910	700,000	18,200,000	12,376,000
Wheat	1911	238,000	2,737,000	2,792,000
	1910	241,000	3,012,000	3,072,000
Oats	1911	110,000	2,420,000	1,355,000
	1910	110,000	2,772,000	1,386,000
Rye	1911	17,000	187,000	168,000
	1910	17,000	219,000	197,000
Potatoes ..	1911	44,000	1,980,000	2,059,000
	1910	45,000	4,140,000	2,774,000
Hay	1911	648,000	a 428,000	8,560,000
	1910	676,000	810,000	12,150,000
Tobacco ..	1911	15,000	b 11,250,000	900,000
	1910	25,000	16,000,000	1,648,000

a Tons. b Pounds.

MINERAL PRODUCTION. The State ranked second in 1910 in the value of the coal produced, taking this position from Illinois, which held it previously. Pennsylvania is the only State producing more coal than West Virginia. The total production in 1910 was 61,671,019 short tons, as compared with a production of 51,849,220 short tons in 1909. The value increased from \$44,661,716 in 1909 to \$56,665,061. The increased production in 1910 was due largely to abnormal conditions, including the strike in the States of the Middle West, which placed Illinois at a disadvantage, most of the larger mines in the latter State being completely shut down. The coal producers of the State suffered from a lack of local markets and the necessity of shipping the product to distant points.

The actual output of the year 1911, according to the chief of the State Department of Mines, was 54,000,000 long tons, or about 60,500,000 short tons, as compared with 61,671,000 short tons in 1910. There were no serious interruptions in the mining industry owing to labor troubles during the year, and the few instances of disaffection which arose were settled satisfactorily within a few hours after the strikes began.

FINANCE. The report of the treasurer showed a balance on hand October 1, 1910, of \$1,415,336. There was received during the fiscal year 1910-11 \$5,379,699. The disbursements amounted to \$5,183,416, leaving a balance on hand September 30, 1911, of \$1,611,620. The total valuation of utilities, personal property, and real estate was

\$1,119,828,173. The rate was 84 cents. per \$100. The State has no bonded debt.

The charitable and correctional institutions of the State, with their population in 1911, are: West Virginia Penitentiary, 1130; West Virginia Reform School, 290; Industrial Home for Girls, 77; West Virginia Hospital for Insane, 1030; Second Hospital for Insane, 530; West Virginia Asylum, 500; Miners' Hospital, Number One, 50; Miners' Hospital, Number Two, 35; Miners' Hospital, Number Three, 33; West Virginia Schools for the Deaf and Blind, 190; Colored Orphans' Home and Industrial School, 100; West Virginia Children's Home, branch of the West Virginia Humane Society, 45.

The institutions were, by act of the legislature passed at the session of 1909, committed to the control of the State Board of Control, which body came into existence on the first day of July, 1909.

POLITICS AND GOVERNMENT

The legislature met in 1911 and the most important measures passed are noted in the paragraph *Legislation* below. The death of Senator Elkins in 1910 and the expiration of the term of Senator Scott made it necessary for the legislature to choose two United States senators. As a result of the elections in 1910 the legislature was Democratic and this insured the election of two Democratic senators. Previous to the session of the legislature, Governor Glasscock appointed Davis Elkins to succeed his father until the legislature could choose his successor. This arrangement could be valid for only a few days or until the legislature should organize. On January 15, fifteen Republican members of the Senate left the State to prevent a quorum for the unseating of two Republicans, whose elections were contested. In the Democratic caucus held on January 18, Clarence W. Watson and W. E. Chilton were nominated to fill the two vacancies. Owing to the absence of the Republican members, who had gone to Cincinnati, O., to be beyond the jurisdiction of the State, and delay the organization and work of the legislature, it was impossible to bring about an election until February 1, when, the Republican members having returned, Messrs. Chilton and Watson were elected. In connection with the election of these senators, charges of bribery were made, but were denied and were not investigated. On February 4, the House of Delegates ratified the income tax amendment, but this was not afterwards ratified by the Senate.

The long-standing contention between Virginia and West Virginia as to how much of the debt of the State of Virginia, incurred prior to the separation of the two States, should be borne by West Virginia, was passed on by the United States Supreme Court in March. The claim of the latter State was that it was not liable for any of this debt, and the question has been in controversy in the courts for many years. The debt was originally incurred largely against the protest of that part of the State now known as West Virginia. The money was used in the development of the eastern region, especially in the construction of railways, canals, and other means of commerce. In the constitution of West Virginia an agreement was made as a part of the articles of separation, that the new State should assume

its proper share of this debt. The amount, however, was never paid. The question before the court was the method of determining the exact share of the debt of West Virginia. The contention of Virginia was that it should be determined on the basis of area and population in 1861, when the two States were divided. The Supreme Court did not agree with these views. The opinion, written by Justice Holmes, was agreed to by all the other members of the court. It suggested that the share be determined on the ratio of assessed valuation of real and personal property in West Virginia to that of Virginia as it was returned for taxation in 1861. The court found that on this ratio Virginia should pay, after certain deductions were made, 76.5 per cent. of the whole debt, and West Virginia 23.5 per cent.

LEGISLATION. The important measures passed at the legislative session of 1911 included the following: A State tuberculosis sanitarium was established. A law prohibiting the manufacture and sale of intoxicating liquors was amended, subject to ratification by the people at the general election held in 1912. Provision was made for the medical examination of all pupils in the public schools of the State. The office of commissioner of agriculture was created.

STATE OFFICERS: Governor, William E. Glasscock; Lieutenant-Governor, H. D. Hatfield; Secretary of State, Stuart F. Reed; Treasurer, E. L. Long; Auditor, John S. Darst; Attorney-General, William G. Conley; Adjutant-General, Charles D. Elliot; Superintendent of Schools, M. P. Shawkey; Secretary of Agriculture, J. M. Millan—all Republicans.

JUDICIARY. Supreme Court of Appeals: President, L. Judson Williams; Associate Justices, George Poffenbarger, Ira E. Robinson, Henry Brannon, William N. Miller; Clerk, W. B. Mathews—all Republicans.

STATE LEGISLATURE, 1911. Democrats, Senate, 15; House, 63; joint ballot, 78. Republicans, Senate, 15; House, 23; joint ballot, 38. Democratic majority, House, 40; joint ballot, 40.

The representatives in Congress will be found in the article *UNITED STATES, Congress*.

WEST VIRGINIA UNIVERSITY. An institution of higher learning at Morgantown, W. Va., founded in 1867. It is under State control and is coeducational and non-sectarian. The university includes the colleges of arts and sciences, law, agriculture, engineering, and mechanic arts; and the department of military science and tactics, the school of music, of fine arts, and the summer school. Tuition is free to residents, except in law and engineering. An agricultural experiment station is connected with the university, the dean of the college of agriculture being the director of the station. In 1910-11 there were enrolled in all departments of the university 1426 students, including the summer school and extension schools in agriculture. There were 80 professors and instructors, exclusive of the station staff. The university is supported by appropriations of the State legislature and by the interest on various funds. The total receipts for 1910-11 were about \$275,000. In July, 1911, Daniel Boardman Purinton, Ph. D., resigned the presidency, after a term of ten years, and was succeeded by Thomas Edward Hodges, D. Sc.,

LL. D. The library of the university contains about 42,500 volumes.

WHALE FISHERIES. See **FISH AND FISHERIES.**

WHARTON, EDITH. See **LITERATURE, ENGLISH AND AMERICAN, Fiction.**

WHEAT. The world's wheat crop in 1911 was estimated at 3,614,443,000 bushels, or about 99 per cent. of the crop of 1910. The area devoted to wheat was estimated at 230,000,000 acres. The production was about 6 per cent. above the five-year average. The principal countries reporting yields lower than in 1910 were the United States, Russia, Rumania, Australia, and Germany. The Russian crop of 1911 was about 25 per cent. smaller than the crop of the year before. The crop season of 1911 in Europe was marked in many sections by a late and cold spring and by very dry and excessively hot weather in July. The dry weather was especially pronounced in Russia. In the United States dry weather in the fall of 1910 and unfavorable climatic conditions during the winter were detrimental to the development of winter wheat and caused a considerable acreage of the crop to be abandoned in Kansas, Oklahoma, and Texas. For the spring wheat crop the season was also quite unfavorable. The preceding dry fall and winter had left the ground and especially the subsoil deficient in moisture. The crop at first made promising growth, but when later in the season the lack of rainfall was almost unprecedented, the prospects of a good yield in the principal spring wheat territory were very much reduced. Among the principal wheat growing countries, Russia produced 627,655,000 bushels in 1911 and 775,695,000 bushels in 1910; British India, 372,000,000 bushels, a record crop, in 1911, and 357,941,000 bushels in 1910; France, 322,375,000 bushels in 1911 and 268,364,000 bushels in 1910; Italy, 193,739,000 bushels in 1911 and 153,337,000 bushels in 1910; Hungary, 135,035,000 bushels in 1911 and 194,600,000 bushels in 1910; and Canada, 204,414,000 bushels in 1911 and 149,900,000 bushels in 1910. The production of wheat in the principal countries of the southern hemisphere for the crop year 1910-11 was as follows: Argentina 137,270,000 bushels, Australia 90,642,600 bushels, Chili 36,350,400 bushels, and New Zealand, 7,342,800 bushels. For the crop year 1911-12 the estimates of production for Argentina, Australia, and Chile were 193,034,000, 73,764,300, and 125,162,000 bushels respectively. A more complete list of yields by countries for the two years is given under **AGRICULTURE.**

The United States produced in 1911 a total of 621,338,000 bushels on 49,543,000 acres, as compared with 635,121,000 bushels on 45,681,000 acres in 1910. The average yield per acre was 12.5 bushels, as compared with 13.9 bushels in 1910, and 15.4 bushels in 1909. The farm value per bushel on December 1, was 87.4 cents. against 88.3 cents. the previous year and the total value of the crop based on these bushel values was \$543,063,000 and \$561,051,000 respectively. The corresponding bushel value in 1909 was 98.6 cents. The winter wheat production of 1911 was 430,656,000 bushels or 3,486,000 bushels less than in 1910 and the area grown was 29,162,000 acres or 1,833,000 acres more than in 1910. The spring wheat yield for the year was 190,682,000 bushels or 10,297,000 bushels less than the year before,

while the area grown was 20,381,000 acres or 2,029,000 acres more than in 1910. The value of the winter wheat crop was \$379,151,000 and the value of the spring wheat crop \$163,912,000. The average yield per acre of winter wheat was 14.8 bushels against 15.9 bushels in 1910, while the average yield of spring wheat for the two years was 9.4 and 11 bushels respectively. The principal winter wheat states among 37 growing this crop in 1911, together with their production, were as follows: Kansas 51,030,000 bushels, Illinois 42,000,000 bushels, Nebraska 38,474,000 bushels, Ohio, 36,240,000 bushels, Missouri 36,110,000 bushels, Indiana 34,354,000 bushels, and Washington 25,116,000 bushels. Of 19 States reporting spring wheat production in 1911, the leading ones were North Dakota, with 73,200,000 bushels; Minnesota, with 43,935,000 bushels; South Dakota, with 14,800,000 bushels; and Washington, with 25,545,000 bushels. In 1910 North Dakota produced 38,500,000, Minnesota 64,000,000, South Dakota 46,720,000, and Washington 18,125,000 bushels.

The data published by the Thirteenth Census show that the area of wheat harvested decreased from 52,580,000 acres in 1899 to 44,261,000 acres in 1909, a decrease of 8,328,000 acres, or 15.8 per cent. In 1879 35,430,000 acres, and in 1889, 33,580,000 acres, were in wheat. The production rose from 658,534,000 bushels in 1899 to 683,350,000 bushels in 1909, an increase of about 25,000,000 bushels, or 3.8 per cent. The average yield per acre was 12.5 bushels in 1899 and 15.4 bushels in 1909.

WHISKEY. See **LIQUORS.**

WHITEHOUSE, FREDERICK COPE. An American lawyer and archaeologist, died November 16, 1911. He was born in Rochester, N. Y., in 1842, and graduated from Columbia University in 1861. He afterwards studied in France, Germany, and Italy, and was admitted to the bar in 1871. The greater part of his life was devoted to travel and study. He discovered in 1882 a depression in the Egyptian desert, now known as the Wadi Raiyan, which in ancient times was used as a reservoir of Nile waters. Mr. Whitehouse contended that without much expenditure of money this depression could again be used as a storage place for water. He filed a claim for the depression with the Egyptian government, but was never able to obtain possession of the tract. He insisted that the English engineers on the Nile blocked the project and he endeavored to secure the aid of the Department of State to enable him to collect \$40,000, which he claimed was due him as reparation from the Egyptian government. He made extensive researches in Semitic traditions relating to the Canal of Joseph and the land of Goshen, which he identified with the Fayum. He was a frequent contributor to magazines on topics relating to astronomy, geology, and other scientific subjects, and on foreign banks and banking.

WHITING, LILLIAN. See **LITERATURE, ENGLISH AND AMERICAN, Literary Biography.**

WICHITA. See **KANSAS.**

WHITAKER, OZI WILLIAM. An American Protestant Episcopal bishop, died February 9, 1911. He was born in New Salem, Mass., in 1830 and graduated from Middlebury College in 1856. He studied theology at the General Theological Seminary, graduating in 1863. In the same year he became rector of St. John's Church

at Gold Hill, Nev., and after remaining there two years became rector of St. Paul's Church in Englewood, N. J. After two years in this pastorate he returned to Nevada in 1867 as rector of St. Paul's Church, Virginia City, and in 1869 was consecrated missionary bishop of Nevada. He was appointed assistant bishop of Pennsylvania in 1886 and in the following year was chosen bishop upon the death of Bishop Stevens. In his service as bishop of Pennsylvania he made great extensions of the work of his diocese and added a large number of church institutions and parish houses to its equipment. In 1909 cataracts developed on both his eyes and he became almost blind. He continued to conduct service until November 5, 1910, when he was obliged to give up active work. He published several volumes of sermons. He received the degree of D. D. from Kenyon College and that of LL. D. from the University of Pennsylvania.

WHITING, WILLIAM. An American paper died January 9, 1911. He was born at Dudley, Mass., in 1841 and was educated in the public schools. He served in various capacities with the Holyoke Paper Company and in 1865 organized the Whiting Paper Company, of which he became president. He was also president of several other manufacturing corporations. In 1872 he was a member of the Massachusetts Senate and in 1878-9 he was mayor of Holyoke. He was elected to the Forty-eighth Congress in 1882, and was reelected to the Fiftieth Congress, serving until 1899. He represented the Sixth Massachusetts District. In 1900 he was a commissioner at the Paris Exposition.

WHITNEY, EDWARD BALDWIN. An American jurist, died January 5, 1911. He was born in New Haven, Conn., in 1857. His father was William Dwight Whitney of the faculty of Yale College. He graduated from Yale in 1878 and after studying law at Yale and Columbia was admitted to the bar in New York in 1880. In 1883 he formed a partnership with General Henry L. Burnett. He later became a member of the firm of MacFarlane, Whitney and Monroe. In 1893 he was appointed assistant attorney-general of the United States, serving in that position until 1897. He aided in arguing the income tax case, the Debs case, and causes arising from the interstate commerce law and from the Cuban insurrection. He also took part in the prosecution of the famous Addyston Pipe case in which President Taft, then a federal judge, wrote (1898) the first judicial decision condemning a manufacturing trust under the Sherman law of 1890. In 1904 he was retained by the Public Service Commission of New York City to defend the eighty-cent gas law. He was a Democrat in politics and was a candidate for the Supreme Court on the Independent ticket in 1906, but was defeated. In 1909 he was appointed a justice of the State Supreme Court by Governor Hughes. In the fall of 1910 he failed of election to the position.

WHITNEY, HENRY MITCHELL. An American scholar and educator, died March 25, 1911. He was born in Northampton, Mass., in 1843 and graduated from Yale College in 1864. He served throughout the Civil War, both in the ranks and as an agent of the United States Christian Commission. He studied theology at Princeton Theological Seminary and at the Andover Theological Seminary, graduating from the latter institution in 1868. In the following

year he was ordained to the Congregational ministry and became pastor of a Congregational Church in Geneva, Ill., remaining there until 1871. In that year he was appointed professor of English literature in Beloit College. After holding this position until 1899 he was chosen librarian of the James Blackstone Memorial Library at Branford, Conn. He took an active part in public affairs and was for many years an alderman of Beloit. He was the joint author of *Columbian History of Education in Wisconsin*; *History of the Fifty-second Massachusetts Regiment*, and *Twentieth Century New Testament*. He also contributed to the *Century Dictionary* and to periodicals. He was well known also as a lecturer.

WHITSITT, WILLIAM HETH. An American theologian and educator, died January 20, 1911. He was born at Nashville, Tenn., in 1841 and was educated at Union University and the University of Virginia. He studied theology at the Southern Baptist Theological Seminary and at the University of Leipzig. He was ordained to the Baptist ministry in 1862. He served in the Confederate army from 1862 to 1865. In the latter year he became pastor of a church near Nashville. He was appointed professor of church history in the Southern Baptist Theological Seminary in 1872 and occupied this chair until 1895. In that year he was elected president of this Seminary, serving until 1899. From 1901 to the time of his death he was professor of philosophy in Richmond College. He was the author of the *History of Origin of Infant Baptism* (1878); *History of Communion among Baptists* (1880); *Origin of the Disciples of Christ* (1888); and *Genealogy of Jefferson Davis* (1908). He was the associate editor of Johnson's Universal Cyclopædia.

WHYMPER, EDWARD. An explorer, artist, and mountain climber, died September 16, 1911. He was born in London in 1840 and was educated at the Clarendon House School and by private teachers. He was sent in 1860 by a London publisher to sketch the Alpine peaks. In the following year he reached the summit of Mont Pelvoux and in 1864 ascended the Pointe des Ecrins. In 1865 he scaled the Matterhorn and was the first man to reach its summit. He made a trip to Greenland in 1867, and a result of his exploration was the collection of fossil plants which are now in the British Museum. His discovery of magnolia cones demonstrated the former existence of luxuriant vegetation in the now frozen north. In 1879 he began mountain climbing in the Ecuadorian Andes and reached the top of Chimborazo. During this trip he discovered several Andean glaciers and made several important fossil collections. When he was past fifty he made several of the first ascents of the Canadian Rockies. His narratives of his explorations and mountain climbings are of great interest and are written in an unusually entertaining vein. Among his best known writings are *Scrambles amongst the Alps in the Years 1800 and 1869* (1871); *Travels amongst the Great Andes of the Equator* (1892); *Chamonix and Mont Blanc* (1896) and *Zermatt and the Matterhorn* (1897). He was a member of the Royal Geographical Society and an honorary member of the Geographical Society of Paris. He was a member also of many European and American mountain climbing clubs.

WILDE, GEORGE FRANCIS FAXON. A rear-admiral, retired, of the United States navy, died December 2, 1911. He was born at Braintree, Mass., in 1845. He entered the United States Naval Academy, graduating in 1864. During the last year of the Civil War and for two years thereafter he served on the flagship *Susquehanna*. He afterwards served on the *Albany*, *Tennessee*, and the *Wabash*, and in 1873 became commander of the monitor *Canonicus*. From 1878 to 1882 he was executive officer of the *Vandalia*. He commanded in 1885 the *Dolphin*, the first steel vessel of the United States navy to circumnavigate the globe. From 1894 to 1898 he served as secretary of the lighthouse board and in this capacity introduced gas-buoys on the Great Lakes and established an electric-light vessel off Diamond Shoal, Cape Hatteras, and had the light ships connected with the shore by telephone. During the Spanish-American War he commanded the ram *Katahdin*, and in 1898 was promoted to the rank of captain. As commander of the *Boston* he landed in China the first American marines ever seen in that country. These were sent to Peking, where they guarded the American legation from November, 1898, to April, 1899. In the latter year he served in the Philippine Islands, capturing the cities of Iloilo and Vigan. In the latter place he rescued 160 Spanish officers and their families and for this he received the thanks of the Spanish government. In 1901 he was captain of the Portsmouth navy yard and was successively captain of the Boston navy yard, commandant of the League Island navy yard, and commandant of the Boston navy yard. He became a rear-admiral in 1904 and was retired in the following year. From 1906 until the time of his death he was chairman of the Massachusetts Nautical Training School Commission.

WILLIAMS, ABRAM PEASE. A former United States senator from California, died October 17, 1911. He was born in New Portland, Me., in 1832 and received an academic education. After working for some time in a store in Fairfield, Me., he removed in 1858 to California, where he engaged in mining, farming, and merchandising. He founded the San Francisco Board of Trade and was its first president. He took a prominent part in politics and was elected United States senator to fill an unexpired term in 1886.

WILLIAMS, JAMES. An English writer and lawyer, died November 3, 1911. He was born in Liverpool in 1851 and was educated at Liverpool College and Lincoln College, Oxford. He became a barrister in 1875. He contributed over one hundred articles to the ninth edition of the *Encyclopædia Britannica*, in addition to many articles in law magazines and reviews. He was the author of *The Schoolmaster and the Law* (1890); *Wills and Successions* (1890); *Law of Education* (1892); *Institutes of Justinian* (1893); and *Dante as a Jurist* (1906). In addition to his legal writings he was the author of *A Lawyer's Leisure* (1884); *Simple Stories of London* (1890); *Briefless Ballads* (1895), and *Ventures in Verse* (1898). In 1906-7 he was high-sheriff of Flintshire. He received the degree of LL.D. from Yale University.

WILLIAMS, JOHN SHARP. United States senator (Democrat) from Mississippi. He was born at Memphis, Tenn., in 1854 and was educated at private schools and at the University of

the South. He studied also at the University of Virginia and at the University of Heidelberg. He studied law at the University of Virginia and was admitted to the bar. In 1878 he removed to Yazoo City, Mississippi where he engaged in the practice of his profession and in the occupation of a cotton planter. He took an active part in State politics and was a delegate to the Chicago Convention, which nominated Cleveland and Stevenson. He served as temporary chairman of the Democratic National Convention in 1904. He served from the Fifty-third to the Fifty-ninth Congresses inclusive and was reelected to the Sixtieth Congress, receiving no opposition for either renomination or election. He was the candidate of his party for the office of speaker in the Fifty-eighth, Fifty-ninth, and Sixtieth congresses. In 1907 he was chosen at a primary election to be the candidate of the Democratic party for the United States Senate and on January 21, 1908, was elected by the legislature to succeed Senator H. D. Money. He took his seat on April 4, 1911. His term of service will expire in 1917.

WILLIAMSON, NOEL. See **EXPLORATION, ASIA.**

WILSON, BENJAMIN LEE. An American educator and critic, died June 23, 1911. He was born in Newark, O., in 1867 and was educated in the public schools of that city. He attended Cornell University where he studied Shakespeare under Professor Hiram Corson (q. v.). For several years following he studied and played under Augustin Daly, combining his work with the study of Shakespeare. In 1893 he became head master at the New York Military School, Cornwall, where he remained until 1900. He left this to establish the Wilson School for Boys at Fishkill, N. Y. In 1910 he returned to the New York Military School as head master. He wrote several books, the best known of which is *The Evolution of the English Drama*.

WILSON, IDA (LEWIS). The keeper of Lime Rock light, and a famous life saver, died October 24, 1911. She was born in 1839. Her father, Hosea Lewis, was the first keeper of the Lime Rock Light. He was crippled with rheumatism and was kept at times from the duties necessary to the place so that his daughter was frequently called upon to help him. She learned the management of the light and became an expert in the handling of the life boat. When she was eighteen years of age her father died and she was allowed to continue in the care of the light until his successor could be appointed. Her first exploit was the saving of four young men on a capsized boat. This took place when she was but fifteen years of age. In February, 1867, a soldier belonging to the garrison of Ft. Adams, was capsized while trying to cross Newport Harbor in a small boat. Miss Lewis went to his aid and towed him to the lighthouse, keeping his head out of the water, as she was not strong enough to lift him into the boat. In March, 1869, she saved two other soldiers in rowing out from the lighthouse after their boat had capsized. In 1877 a boat containing three men was overturned in Newport Harbor in a gale. Miss Lewis, alone in her small boat, dragged the men from the water. In 1881 she rescued two soldiers who had attempted to cross on the ice from Newport to Ft. Adams. In this exploit she and her brother nearly lost their lives. In 1904 when she was more than sixty-

five years of age she performed her last feat of life saving. This was the rescue of a woman friend who fell overboard near the pier at the Lime Rock Light. In all she saved twenty-two lives. She received the thanks of Congress and a gold medal. She was also given a cross from the American Cross of Honor Society and was the recipient of many gold and silver medals. The citizens of Newport presented her with a boat named the *Rescue*. She received many other evidences of public recognition for her heroism. In 1869 the Life Saving Benevolent Association of New York awarded her a prize of \$100 and a silver medal. In the same year the general assembly of Rhode Island recognized her services officially. In 1878 by a special act of Congress she was made keeper of the Lime Rock Light. In 1907 she celebrated her golden anniversary of this position. In the same year she received from Andrew Carnegie a pension of \$30 a month. When she was about thirty-five years old she was married, but separated from her husband and resumed her maiden name.

WILSON, WILLIAM ROBERT ANTHONY. An American author and physician, died May 14, 1911. He was born in Washington, Ill., in 1870, and graduated from Williams College in 1892 and at the College of Physicians and Surgeons in New York in 1895. After practicing for a short time in Peoria, Ill., he was obliged, on account of ill health, to abandon it and to travel extensively for several years. In 1906 he removed to Pittsfield, Mass., and devoted himself to literary work. He was the author of *The Rose of Normandy* and *A Knot of Blue*. He also wrote several boys' books, which were widely known. These included *Comrades Three* and *Journeys of the Kit-Kat Club*.

WILSON, WOODROW. See NEW JERSEY, and UNITED STATES, Elections in 1912.

WINDWARD ISLANDS. A group of islands, the windward or southern group of the British West Indian islands. See BARBADOS, ST. LUCIA, ST. VINCENT, and GRENADA. Sir James Hayes Sadler (1911), residing at St. George's, Grenada, is governor and commander-in-chief of the group; but each colony has its separate government.

WINE RIOTS. See FRANCE.

WINES, CONSUMPTION OF. See LIQUORS.

WINNEBAGO. See ANTHROPOLOGY.

WINTER, Sir JAMES SPEARMAN. A public official of Newfoundland, died October 7, 1911. He was born at Lamaline, Newfoundland, in 1845. In his youth he was a clerk in a merchant's office, but studied law and was called to the bar in 1867. He was a member of the House of Assembly from 1874 to 1889, in 1893, and from 1897 to 1900. In 1877 and 1878 he was speaker of the house. He afterwards became successively a member of the Executive Council, solicitor-general, and attorney-general, and was elected the leader of the opposition. He represented Newfoundland at the Washington Fisheries Conference in 1887. In 1893 he was raised to the Newfoundland bench, but three years later resigned and resumed the practice of law. He was soon afterwards chosen leader of the opposition and on the fall of the White-way government in 1897, became premier, holding this office until 1900.

WINTERBURN, GEORGE WILLIAM. An American physician and editor, died November 18, 1911. He was born in New York in 1845.

He spent a year in the Cincinnati Law School and then studied in the Ohio Medical College, Cincinnati, at the University Medical College, in New York, and the Eclectic Medical College in the same city. He received his medical degree from the last named institution in 1875. Before studying medicine he had engaged in newspaper work and had been New York correspondent for several medical journals and an editorial writer on the *New York Evening Post*. In 1882 he became editor of the *American Homœopathist*, and five years later, editor of the *Homœopathic Journal of Obstetrics*. From 1878 to 1882 he was professor in the Eclectic Medical College and in 1883-84 in the United States Medical College in New York City. He was a contributor to various medical publications.

WIRELESS TELEGRAPHY AND TELEPHONY. The distance covered by the high-power transmission stations have continued to advance greatly. The service between the Eiffel tower at Paris and American stations has reached a commercial basis. A new high-power station at Coltona, Italy, is reported to possess a 1000-kw. sender, from which messages have been received at Glace Bay, Nova Scotia, a distance of 4000 miles. Messages from the 400-kw. station at Clifden, Ireland, are reported to have reached South American stations 7000 miles distant. In the realm of apparatus the trend of development has been along the line of the quenched gap and frequencies of approximately 1000 per second.

An important new installation is that of the Navy Department at Washington, D. C., which is to have a 100-kw. transmitter and three towers, one 600 feet and two 450 feet in height. This will afford a range of between 2000 and 3000 miles for communication with ships. The German station at Nauen, the second highest in Europe, is being increased from 100 meters to 200 meters and is expected to rival the Eiffel tower in working range.

Captain Brenot of the French army succeeded in sending messages to the Eiffel tower when flying at a height of 1650 feet and at distances varying from 25 to 35 miles. The apparatus has a gross weight of but 50 pounds, power being derived from the gasoline motor of the aeroplane. An aerial wire, 120 feet in length, is unrolled while in flight.

Wireless telephony remained in an inactive state during 1911, the few trials which were reported involving small outfits covering a range not exceeding 50 miles. The progress of all types of wireless communication is much retarded by the uncertainty of the patent situation, pending the decisions of the highest courts on suits covering basic principles. A recent decision in England fully sustained the Marconi claims.

WISCONSIN. POPULATION. The Thirteenth Census showed a population in 1910 of 2,333,860, compared with 2,069,042 in 1900, an increase of 12.8 per cent. in the decade. The principal cities with their populations in 1910 and 1900 are given below (the figures in parentheses are for 1900): Milwaukee, 373,857 (285,315); Racine, 38,002 (28,284); Lacrosse, 30,417 (28,895); Madison, 25,531 (19,164).

AGRICULTURE. The Thirteenth Census included statistics relating to agriculture. The figures are of date of April 15, 1910. At that time

there were in the State 177,127 farms, as compared with 169,795 in 1900, an increase of 4.3 per cent. The land in farms in the State amounted to 21,060,466 acres, and the improved land in farms to 11,907,606. The average number of acres per farm was 119. The total value of farm property was \$1,413,043,000, as compared with \$811,712,000, an increase of 74.1 per cent. The average value of all property per farm was \$7978, and the average value of land per acre was \$43.30. Of the total number of farms, 152,473 were operated by owners and managers, while 24,654 were operated by tenants. Of the farms operated by persons owning all or part of the land, those free from mortgage in 1910 numbered 72,941, while those under mortgage amounted to 77,139. Of the farmers of the State 107,180 were native white, 69,356 were foreign-born white, and 591 were negro and other non-white.

The domestic animals and poultry in the State in 1910 were valued at \$158,454,043, as compared with a value in 1900 of \$96,327,649. The cattle numbered 2,678,160, valued at \$67,399,856; horses and colts, 614,654, valued at \$68,585,513; mules, 2872, valued at \$316,066; swine, 1,809,331, valued at \$13,620,741, and sheep and lambs, 929,783, valued at \$3,669,572. The poultry of all varieties numbered 9,433,110, valued at \$4,468,703. The acreage, production, and value of the principal crops in 1910 and 1911 are shown in the following table:

	Acreage	Prod., bu.	Value
Corn1911	1,600,000	58,080,000	\$34,848,000
1910	1,520,000	49,400,000	25,688,000
Wheat1911	195,000	3,097,000	2,788,000
1910	186,000	3,590,000	3,302,000
Oats1911	2,250,000	67,050,000	80,172,000
1910	2,250,000	67,050,000	22,797,000
Rye1911	355,000	6,035,000	5,069,000
1910	340,000	5,440,000	3,862,000
Potatoes ..1911	280,000	32,480,000	20,138,000
1910	280,000	26,600,000	10,108,000
Hay1911	2,079,000	2,495,000	38,922,000
1910	2,260,000	2,260,000	34,125,000
Tobacco ...1911	41,000	551,250,000	5,125,000
1910	34,000	35,700,000	2,677,500
a Tons. b Pounds.			

MINERAL PRODUCTION. The State ranks fifth in the production of iron ore. In 1910 there were mined 1,149,551 long tons, valued at \$3,610,349, compared with 1,067,436 tons, valued at \$2,727,406 in 1909.

EDUCATION. The number of children of school age in the State in 1909-10 was 780,008. The enrollment was 460,065. The school houses in the State numbered 7769, with a seating capacity of 575,439. The male teachers employed numbered 1718, and the female teachers, 13,011. The average monthly salary of male teachers, outside of cities, was \$66.69, and of female teachers, \$44.29.

CHARITIES AND CORRECTIONS. The names of the institutions under the State Board of Control, with their population and expenditures for the year ending June 30, 1911, are as follows: State Hospital for Insane, 591, \$162,286.36; Northern Hospital for Insane, 608, \$168,890.39; School for the Deaf, 198, \$64,546.03; School for the Blind, 86, \$37,618.76; Industrial School for Boys, 368, \$77,903.08; State Prison, 708, \$136,830.40; State Public School, 162, \$57,448.22; Home for Feeble-minded, 979, \$168,844.46; Wisconsin State Reformatory, 246, \$67,189.44; State

Tuberculosis Sanatorium, 120, \$98,447.56; total population, 4066; total expenditures, \$1,040,004.70.

During the year ending June 30, 1911, a number of improvements were made at the State institutions and a number of additional buildings were constructed. A new dormitory at the Wisconsin Industrial School for Boys was built at a cost of \$25,000. The operation of the parole law or the law permitting the parole of persons from the Wisconsin State Prison which was enacted in 1907 has shown very satisfactory results. The probation law which was enacted in 1909 has also given satisfactory results up to the present time, but it has not been in operation a sufficient length of time to justify a determination as to its final results.

POLITICS AND GOVERNMENT

The legislature met in 1911 and passed an unusual number of important measures, which will be found noted in the paragraph *Legislation*, below. The provisions of the income tax referred to in that paragraph are, in the main, as follows: On incomes over \$500 the recipient must make a return to the assessor. In the case of unmarried persons the income will be taxed when it passes the \$800 mark. Married men are taxed on incomes when they amount to over \$1200. The tax is graduated, starting at 1 per cent. on incomes of \$1000 or any part of it, and increasing one-fourth of 1 per cent. on each added \$1000, until \$12,000 is reached, when the tax is 5½ per cent. On incomes over \$12,000 the tax is 6 per cent. Corporations are allowed exemptions on sums paid for salaries and wages, if such corporation return to the assessor the amounts of such salaries and the names of those receiving them. In computing the tax and exemptions, the incomes of husband, wife, and each child under eighteen years of age is added when all live together. United States officials are exempt so far as their salaries are concerned, as are pensions from the United States, and salaries of members of the legislature.

The legislature approved an amendment to the woman suffrage bill, and the measure will be submitted to the people. On January 25, Senator La Follette was reelected to the United States Senate. He received 83 votes, or 16 more than were necessary to elect.

A committee to investigate the election of Senator Isaac E. Stephenson in connection with alleged charges of corruption, reported to Governor McGovern on January 11.

Senator Stephenson was charged with violating the statute which requires that an account under oath of all campaign expenditures be filed. It was also alleged that such violation was premeditated. It was further charged that he violated the law which prohibits anyone from contributing money to assist a candidate for the legislature residing outside of the district in which the contributor resides. The charge was made that Senator Stephenson was elected by the legislature to the United States Senate by a majority of three votes, while the charges of corruption against him were being investigated by the legislature. In June the legislature passed a resolution calling on the United States Senate to investigate the election of Senator Stephenson in accordance with the charges made by this investigating committee, and on August

12 the committee on privileges and elections in the Senate, after a consideration of the charges, recommended an investigation of them. This investigation was carried on during the summer and autumn of 1911. The testimony showed that Mr. Stephenson had expended over \$100,000 in bringing about his election to the Senate, but the evidence adduced to the end of the year had failed to show that any of this had been spent for the corruption of legislators, and the indications were that Senator Stephenson would be exonerated by the Senate committee.

Municipal elections were held on April 4. The most interesting results were in Milwaukee where the Socialists controlled the city government and the Socialist candidates for judicial and school board offices were defeated by a combination of the Democratic and Republican parties. Judge W. H. Halsey was reflected circuit judge by about 10,000 votes over Judge J. C. Kleist, the Socialist candidate. The Socialists made a campaign on the issue of the Catholic Church participating in the election. Two Socialists were elected members of the school board.

LEGISLATION. The legislature which ended its session July 10, 1911, passed an unusually large number of important laws. These laws were passed under the leadership of Governor McGovern. Three important measures were passed affecting industrial conditions. One of these was the Workmen's Compensation act. This act was drafted in accordance with conclusions reached after careful investigation and the securing of best advice of authorities in America and Europe. The act gives the employer or employee option to take his chance in an ordinary lawsuit if he prefers, in case of accident, but it requires that in the lawsuit ordinary common law defenses shall not be held valid. The measure provides for an automatic method by which the State will assure, on the one hand, proper compensation to the employee, and on the other, a reasonable and fixed amount of the expenses of the employer for any accident. A second important measure affecting industrial conditions was the creation of an industrial commission to administer all labor laws, including those concerning workmen's compensation, factory regulations, hours and conditions of labor among workmen and children, a truancy and other statutes falling in this broad classification. The third industrial measure was the law limiting the working hours of women in gainful occupations to ten in the daytime and eight at night. Important measures relating to elections and the government were also passed. One of these requires complete records of all legislative committee meetings, including votes of committee members on all bills and amendments. The corrupt practices legislation was made more strict, and in addition to amendments to the direct primary law, a limited form of initiative, referendum, and recall was adopted. Cities are empowered to have recourse to the initiative and referendum on charter amendments and ordinances and to apply the recall to all municipal officers with the exception of judges. The fullest power was given to cities to govern themselves under special charters. Important measures were passed also relating to the conservation of water power and reforestation. An income tax law was adopted which applies to incomes as small as \$800. In the case of married

persons, however, the minimum amount is \$1200. The question of woman suffrage was referred to the people to decide in the general elections of 1912.

STATE OFFICERS. Governor, F. C. McGovern; Lieutenant-Governor, Thomas Morris; Secretary of State, James A. Frear; Treasurer, Andrew H. Dahl; Attorney-General, L. H. Bancroft; Superintendent of Education, C. P. Cary, Commissioner of Insurance, H. L. E. Kern; Commissioners of Public Lands, Secretary of State, Attorney-General, and State Treasurer—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, John B. Winslow, Dem.; Associate Justices, William H. Timlin, Dem.; R. G. Siebecker, Dem.; A. J. Vinje, Rep.; Rouje D. Marshall, Rep.; J. C. Kerwin, Rep.; John Barnes, Dem.; Clerk, Clarence Kellogg, Rep.

STATE LEGISLATURE, 1911. Senate, Republicans, 27; Democrats, 4; Social Democrats, 2; Assembly, Republicans, 59; Democrats, 29; Social Democrats, 12; joint ballot, Republicans, 86; Democrats, 33; Social Democrats, 14. Republican majority, Senate, 21; Assembly, 18; joint ballot, 39.

WISCONSIN, UNIVERSITY OF. An institution of higher learning at Madison, Wis., founded in 1848. The number of students enrolled in the various departments of the university in 1910-11 was 5499. Of these 3934 were men and 1565 were women. The enrollment in the various departments was as follows: College of letters and science, 1409 men and 1146 women; college of agriculture, 1094 men and 110 women; college of engineering, 797 men and 1 woman; law school, 156 men and 1 woman; library school, 18 women; school of music, 2 men and 67 women; graduate school, 464 and 219 women; medical school, 6 men and 2 women; pharmacy course, 46 men and 1 woman. The faculty numbered 486 teachers, with 31 teachers in the extension club. During the year \$31,735 were received as the Carl Schurz Memorial Fund. The amount of productive funds of the university, which is supported almost entirely by the State, was \$650,298, and the income for 1910-11 was \$1,854,910. The library contains about 140,000 volumes. President, 1911, Charles R. Van Hise, Ph. D.

WISTER, OWEN. See **LITERATURE, ENGLISH AND AMERICAN, Fiction.**

WOLVERHAMPTON, Sir HENRY HARTLEY FOWLER, Viscount. An English public official, died February 25, 1911. He was born at Sunderland in 1830 and was educated privately, his father being a minister of the Wesleyan Methodist Connection. He was trained for the legal profession and was admitted as a solicitor in 1852. He became successful as a practitioner and after devoting some years to his profession he entered the town council at Wolverhampton. He was elected mayor of the borough in 1863. At the general election of 1880 he was elected to the House of Commons as a Liberal. In 1884 he was offered the under-secretaryship at the Home Office, which he accepted. When Parliament was reassembled in 1886 he was already a conspicuous figure in politics and he was appointed financial secretary, probably the most important post outside the cabinet. He was not altogether in sympathy with Mr. Gladstone's Home Rule bill, but loyally supported it. From 1886 to 1892 he took little part in active de-

liberations of Parliament. When in the latter year Mr. Gladstone came again into power, Sir Henry was appointed president of the Local Government Board and in the reconstructed government after Mr. Gladstone's retirement, he became secretary of state for India, 1894-95. He did not take a conspicuous part in the deliberations of Parliament from 1895 to 1900. He heartily supported Lord Rosebery during the long struggle over the Liberal leadership. During the South African War he refused to associate himself with Sir Henry Campbell-Bannerman and others, who had denounced the assertion of British power after the challenge of the Boers. He opposed the education bill as a representative of the militant non-conformists, but made efforts to bring about a compromise which, however, were unsuccessful. In 1905 when Campbell-Bannerman formed his government before the general election, Sir Henry was made chancellor of the Duchy of Lancaster. In 1908 he accepted a peerage and took the title of Viscount Wolverhampton. In October, 1908, he became lord president of the Council. Lord Wolverhampton was prominent in the Wesleyan Methodist body.

WOMEN IN INDUSTRY. LEGISLATION. A considerable number of new laws were enacted in 1911, extending the legal protection of women workers as to hours and wages. The most prominent feature of the progress was the extensive agitation for eight-hour laws. Bills providing for eight-hour days were enacted in California and Washington; and they were defeated in Illinois, Ohio, Wisconsin, and Colorado. The California law forbids the employment of women for more than eight hours in any one day or forty-eight hours in one week, in manufacturing, mechanical, mercantile, telegraph or telephone establishments, laundries, hotels or restaurants, or by express or transportation companies. An exemption is made of harvesting, curing, canning, or drying of perishable fruits and vegetables. The Washington law is slightly less comprehensive and makes similar exemptions. Wisconsin passed an eight-hour law applying to work between eight P. M. and six A. M. Laws providing for a nine-hour day and a fifty-four-hour week were passed in Nebraska and Utah. Massachusetts reduced the hours per week from fifty-six to fifty-four. Ten hour laws were passed in Ohio and Wisconsin, the hours per week in the former State being limited to fifty-four and in the latter to fifty-five. Moreover, the ten-hour law of Illinois was extended. South Carolina provided for a twelve-hour day and a sixty-hour week; and Georgia and North Carolina reduced the hours per week from sixty-six to sixty.

Other enactments included the first American law forbidding the employment of women immediately before or after childbirth. This was passed in Massachusetts and was effective January 1, 1912. It provided that no women should be employed in mercantile, manufacturing, or mechanical establishments within two weeks before or four weeks after childbirth. The maximum penalty for violation was put at \$100. This law still falls short of the best European legislation whereby maternity insurance is provided for the period of unemployment. Connecticut and Utah forbade the employment of women in any saloon. Separate toilets and dressing rooms were required in Nebraska; and seats in mercantile establish-

ments in Maine, Ohio, and Washington. The Ohio law moreover required that suitable lunch rooms separate from work rooms, must be provided in certain establishments including factories, workshops, business offices and bakeries and not less than thirty minutes must be given for the lunch period; where lunch rooms cannot be provided at least one hour must be allowed.

GOVERNMENT REPORT. The most comprehensive and detailed report ever made upon labor conditions in the United States is the *Report on Condition of Woman and Child Wage-earners in the United States*. This was undertaken by the commissioner of labor under the authority of an act of Congress in 1907. It comprises nineteen volumes, covering all phases of the employment of women and children in all parts of the United States. It is impossible to do more than hint at the contents of these volumes, but some idea of the thoroughness of the investigation may be gained from a brief summary of volume 2. This dealt with the manufacture of mens' clothing in 244 factories employing 23,863 wage-earners in New York, Chicago, Philadelphia, Baltimore, and Rochester. These five cities produced more than two-thirds of the men's ready-made clothing. The report showed that 96.6 per cent. of the factories in New York City employing children, were violating some provision of the child labor laws, as compared with 57.1 per cent. in the others. At least one-third of the New York establishments were violating laws regulating the hours of employment of women. In fifty establishments 4400 women and children workers were not allowed to use elevators. In 134 factories there were no dressing rooms; toilet conditions ranged from "filthy to bad" in from one-fourth to two-thirds of the establishments.

Wages everywhere were found to be low, \$10 per week being the upper limit. The proportion of women workers earning less than \$6 per week ranged from 31.4 per cent. in Rochester to 52.4 per cent. in New York, 58 per cent. in Philadelphia, and 77 per cent. in Baltimore. Marked differences in rate of pay were found even in the same city, there being no standard wage anywhere. Women uniformly received less than men for the same work; and home-workers received less than shop-workers. The average weekly wages for the latter were found to be \$7.30 in Chicago, \$7.04 in Rochester, \$6 in New York, \$5.75 in Philadelphia, and \$4.74 in Baltimore. Hours per week were shortest in Chicago and longest in Baltimore; so that long hours and low weekly wages went together. Hourly wages are also given. Of the nearly 2400 workers in these establishments, 49 per cent. were women, most of whom were low-grade hem-sewers. Only 16 per cent. of the women in New York establishments were operators or highest-grade workers; while 33 per cent. of those in Chicago were operators. Women were found to earn about 70 per cent. as much as men in the same processes in Chicago and 60 per cent. as much as in other cities. Though the earnings of women were found to increase up to the age of forty, there was little increase after the age of twenty-five; the increase of earnings with age for men was found to be greater and to extend over a longer period of time.

The nationalities employed varied with the city. In New York, Italian women constituted

practically all the home-workers, and about 70 per cent. of the shop-workers; about 15 per cent. of the latter were Hebrews. Germans were most numerous in Rochester and Italians in Baltimore; but in Chicago, Bohemians, Poles, Italians, Hebrews, Scandinavians, and Germans were found in tolerably equal proportions. In all nearly two-thirds of the women were foreign-born, and more than one-fourth were native-born of foreign parents, only 7.5 per cent. being Americans of native parentage.

The home-workers constituted the hardest worked and lowest paid of those engaged in the mens' clothing industry. Their average yearly earnings were found to be only \$126; yet 95 per cent. had been married and 60 per cent. were at least thirty years old. About seven-eighths of the home-workers had husbands at work, though in almost all cases at less than ten dollars per week. Though most of the home-workers families had small children, the average family income was only \$515 per year of which the husband earned only one-half. The investigators found that 44.7 per cent. of the finishing work in New York city was done at home and concluded that, "undoubtedly the actual amount of home finishing is greater today than ever." In this connection the report stated that in spite of many laws "it has proved impossible to guarantee that clothing made or finished in homes is free from disease or vermin."

The titles of the first twelve volumes of this report are as follows: *Cotton Textile Industry; The Clothing Industry; The Glass Industry; The Silk Industry; Wage-Earning Women in Stores and Factories; The Beginnings of Child Labor Legislation in Certain States; A Comparative Study; Conditions under which Children leave School to go to Work; Juvenile Delinquency and its Relation to Employment; History of Women in Industry in the United States; History of Women in Trade Unions; Employment of Women in Metal Trades; Employment of Women in Laundries*. Among the subjects treated in the remaining seven volumes are: *Relation of Occupation to the Criminality of Women; Causes of Death among Woman and Child Cotton-Mill Operatives; and the Employment of Women and Infant Mortality*.

EARNINGS. One of the several private studies of the earnings of women was published under the title "The Living Wage of Women Workers" by the department of research of the Woman's Educational and Industrial Union. This was based on 450 schedules of incomes and expenditure in Boston. The investigator found that "the increased income up to \$8 is used to provide a better dietary. The slighter increase both in regular board and extra food in the next higher division (that is, \$9 to \$11 per week) would seem to indicate that the most pressing needs in these directions are met at about a \$9 wage." In general the investigator concluded that a decent living was within the reach of those women receiving from \$9 to \$11 per week. The average expenditures of the women of this group amounted to \$504.28 for the year studied, distributed as follows: food \$189.70, rent \$74.81, clothing \$88.99, health \$22.09, savings \$31.63, and miscellaneous \$117.06. The conclusion seemed clear that a wage of \$10 a week was necessary in Boston to provide a tolerable living and the absolutely necessary minimum savings for adversity.

MINIMUM-WAGE BOARDS. Following the enactment of the English law of 1909, effective early in 1910, authorizing the establishment of minimum-wage boards in various industries, some demand for similar legislation developed in this country. Early in February, 1911, the Massachusetts State Federation of Labor introduced a bill providing for a commission to investigate this subject. Shortly thereafter a bill was introduced in the Minnesota legislature providing for the establishment of "industrial boards for the protection of wage-earning women and minors." By the middle of February a bill was introduced into the Wisconsin legislature at the instigation of the State Consumer's League providing for minimum-wage boards. The Minnesota bill provided for boards to be composed of representatives of employer, employees and the public; there was to be a separate board for each trade, these boards would have power to fix minimum time and piece wages, which were to be compulsory on all the employers in the trade. The State board of arbitration was authorized to establish such a board in any industry employing women or minors upon its own initiative or when petitioned by twenty-five persons affected. These boards were to consist of representative members and appointed members, the former named by the two sides and the latter by the State board of arbitration; one-fourth of all must be women. The industrial boards thus created were to be empowered to create district boards with considerable powers in their respective districts. Neither the Minnesota nor the Wisconsin bill was passed.

In Great Britain minimum-wage boards have been established in chair-making, in certain branches of lace-making, in card-board box making, and in the men's ready-made clothing industry.

ORGANIZATION. The principal organization for the promotion of group effort among the women workers in this country is the National Woman's Trade Union League. This now has branches in all principal cities and carries on various lines of activity designed to bring women workers together and otherwise to promote their welfare. Its demands include the following: an eight-hour day, the elimination of night work; separate toilet rooms; increased sanitation and safety; seats and permission to use them; pensions for working mothers during the lying-in period; more women factory inspectors; women physicians in factories; and a minimum-wage law for sweated industries.

BIBLIOGRAPHY. The great attention being given to the economic and social status of woman has resulted in a very large output of literature bearing on her position in industrial life. In addition to the very considerable amount of magazine literature the following books may be noted: Abbott, *Women in Industry, a Study in American Economic History*; Mussey (ed.), *The Economic Position of Women*, a symposium of twenty-eight contributors; Dorr, *What Eight Million Women Want*; Kingsbury (ed.), *Labor Laws and Their Enforcement, with Special Reference to Massachusetts*; Schreiner, *Women and Labor*; Bosworth, *The Living Wage of Women Workers*; Chaboseau, *La réglementation du travail des femmes et des enfants aux Etats-Unis*; Wright, *Sweated Labour and the Trade Boards Act*.

WOMAN SUFFRAGE. UNITED STATES.

The chief event in the record of the woman suffrage movement in the United States during the year was the adoption by California on October 10, 1911, of the equal suffrage amendment, conferring the vote on about 400,000 women. This brought the number of States having woman suffrage to six, the others being Wyoming (1890), Colorado (1893), Utah (1896), Idaho (1896), and Washington (1910). In both Wyoming and Utah, however, women had voted under the Territorial government for many years. By the close of 1911 four other States had undertaken to submit the question to the people in 1912, namely, Kansas, Wisconsin, Oregon, and Nevada. Bills for the submission of a woman suffrage amendment were introduced in 1911 in the legislatures of twenty-two States, and in most instances received larger votes than ever before. On the whole the year was marked by unusual activity and success on the part of the suffragists. For the important part played by women voters in the elections of California and Washington, see the articles on those States. In New York City popular interest was aroused by a suffrage parade on May 5, when 3000 women, including many of prominence, marched down Fifth Avenue, with banners and floats, between lines of spectators extending over two miles. Women possess the school suffrage in more than half the States, the municipal suffrage in Kansas, the tax-paying suffrage in Louisiana, Iowa, Michigan, Delaware, and Montana, and in the villages and many third-class cities of New York.

FOREIGN COUNTRIES. For an account of the continued violence of the militant suffragists in Great Britain and of the government's position on the suffrage question, see *GREAT BRITAIN, paragraphs on History*. In Norway, the bill to abolish the property qualifications for the full suffrage was defeated in 1911, lacking five votes of the requisite two-thirds majority. For the first time a woman sat in Parliament (see *NORWAY, History*). In Sweden the suffragists were active in supporting the Liberals and Social Democrats and contributed materially to the Conservative defeat (see *SWEDEN, History*). In France, Parliament having appointed a committee to investigate the workings of woman suffrage in the countries in which was adopted, a full report on the subject, favorable in its findings, was published in 1911. In Prussian Silesia an unusually large number of women availed themselves of the privilege of woman landowners to vote by proxy in communal matters. In Switzerland Zurich and Geneva gave women the right to vote for members of the board of trade and to serve as members themselves, and the latter city gave them the right to vote in church matters.

WOOL. According to the annual wool review there were on April 1, 1911, 36,761,000 sheep fit for shearing in the United States, a decrease of 2,238,500 from 1910. This decrease occurred mainly in the sheep of the Far Western States, whereas in most Southern and Central States there was a slight increase. The estimate of the domestic clip for the year 1911 is 277,547,900 pounds, a decrease of 3,814,850 pounds, and of pulled wool 41,000,000 pounds, or 2,818,850 pounds less than 1910. This total wool product is equivalent to 139,895,195 pounds of scoured wool valued at \$66,571,337, or nearly \$6,000,000 less than that of the previous year.

The average weight of domestic fleeces was 6.98 pounds, and the average shrinkage 60.4 per cent. The average value per scoured pound of the domestic wool clip for 1911 is set at 47.7 cents, as compared with 51 cents in 1910, 63.6 cents in 1909, 46.6 cents in 1908, and 62.3 cents in 1907.

Like the previous year, 1911 was one of severe trial to the American growers, and has been reflected not only in the shrunken number of sheep but in the fall in value. The principal cause assigned for this is the agitation due to the supposed exigencies of party politics, as the year opened with a good wool market and the spring clip was in good condition. There is no export market for wool, and a high tariff on wool is of no value to the wool producer unless the American woolen mills are running.

At the close of the year the wool market was not encouraging. The future of the sheep industry in this country seems to be in the management of small flocks in the corn belt or in the East, rather than extremely large ranges. A recent development of the industry has been the warehouse idea, which aims to furnish the grower with storage facilities for carrying his wool until a satisfactory market can be secured. Another development is the scouring mill in the wool-growing regions, which affords the grower the opportunity to have his product scoured and sold to the manufacture on its merits.

According to the preliminary statement of the Thirteenth Census, there was a decrease of 3.8 per cent. in the number of fleeces between the years 1900 and 1910, but the average weight of the fleece increased one half pound, so that there is an actual increase in the production of wool during the decade, and also an increase in value of 6 cents per pound. But, summing up the results on the whole there was no material change in the sheep industry between the years 1900 and 1910, as a decrease in some States was compensated for by increases in others.

In Australia a record clip was shown for the fiscal year ending June 30, 1911. The overseas exports, of which Europe took 91 per cent., amounted to 646,838,877 pounds from Australia and 173,173,572 pounds from New Zealand. The total value exported from the two countries amounted to \$150,377,380. The previous year was exceeded by about 3,000,000 pounds, or nearly double the figures of 1903 and 1904. The flocks in Australia contained fewer sheep than twenty years ago, but the amount of wool shown is larger and the clip is superior in quality, as improvement in breeding has produced larger and better fleeces, the average weight of fleece now being 7 pounds 4 ounces each. The average price for the year for Australian wool was 18 cents, as compared with 19½ cents in 1909 and 1910.

Australia is extending its flocks of fine wools. The long wools and coarse breeds are also increasing along the coast districts. In New Zealand, where there are twenty-four sheep for each inhabitant, a change is taking place from fine wool to coarse wools and cross-bred. In South Africa fine wools are slowly expanding, whereas in Argentina mutton breeds are expanding at the expense of fine wools. Sheep stock of all kinds seems to be gradually decreasing in Europe.

An important event to the wool industry of the United States was the report of the Tariff Board late in the year, which studied the expense account of more than 1200 American and many foreign sheep breeders, mainly producers of fine or Merino wools. It was found that the highest average cost in the production of such wool is in Ohio and contiguous territory. The lowest average cost of similar wool is in Australia. In Australia, New Zealand, and South Africa the sales of sheep and mutton practically paid the entire flock expense, and in South America all expenses within four cents on each pound of wool. But the fine wools of the Ohio region are sold bearing an average charge for production of nineteen cents per pound. In the States east of the Missouri River wool production is incidental to general farming, and in certain cases it was found that the sale of sheep and lambs nearly quite covered the flock expense where the coarser mutton breeds were grown. In the western part of the United States, where about two-thirds of the fine wools are grown, the average charge was at least eleven cents per pound. There are in the United States about 10,000,000 sheep of the coarse breeds, as against 40,000,000 of the Merino type. See **TARIFF**.

WORDSWORTH, JOHN. A bishop of the Church of England, died August 16, 1911. He was born in Harrow in 1843, the oldest son of Dr. Christopher Wordsworth, a nephew of the poet, William Wordsworth. He was educated at Ipswich and Winchester and at New College, Oxford. He was ordained a deacon in 1867 and a priest in 1869. In the following year he was made a prebendary of Lincoln Cathedral by his father who had been appointed bishop of Lincoln. Earlier even than this he had gained a reputation as a scholar. He published in 1870 *Lectures Introductory to a History of Latin Literature*. This was followed four years later by *Fragments and Specimens of Early Latin*. In 1876 he was appointed Grinfield Lecturer on the Septuagint. From 1875 to 1877 he was select preacher. In 1881 he was Bampton lecturer, taking as his subject "The One Religion, Truth, Holiness, and Peace, desired by the Nations and revealed by Jesus Christ." In 1883 he was appointed to the professorship of the interpretation of the Holy Scripture in Oriel College, Oxford, together with a canonry in Rochester Cathedral. He continued his studies in Latin with especial attention to the Latin text of the Scriptures. In 1883 was issued his first set of *Old Latin Biblical Texts*, and others were issued in 1886. From these he passed to the text of the Vulgate, in which he was chief English authority. In 1885, on the death of Dr. Moberly, he was appointed bishop of Salisbury. His knowledge of Latin was frequently made use of by the officials of the church. Special instances of this are to be found in his Latin letter to the archbishop of Utrecht on English Episcopal orders and the answer to the Papal bull *Apostolica Curæ*. On the question of extreme ritual and doctrine he maintained a scholarly and a moderating attitude, which was described at length in *The Ministry of Grace* (1901). He was himself a High Churchman, but at times of ecclesiastical agitation took no part in newspaper polemics and resented outside interference between himself and his clergy. He was considered the most learned of English bishops.

Among his writings, in addition to those mentioned are: *The Four Gospels* (with Rev. H. J. White) (1898); *The Acts* (1904); *The Episcopate of Charles Wordsworth* (1898); *Bishop Sarapion's Prayer-book* (1899), and *Teaching of the Church of England for Information of Eastern Christians* (1904).

WORKS, JOHN DOWNEY. United States senator, Republican, from California. He was born in Ohio county, Indiana, in 1847. He was reared on a farm until 16 years of age, when he enlisted in the Union army in the Civil War. He served eighteen months, until the close of the war. After studying law he was admitted to the bar and practiced his profession for fifteen years at Vevay, Ind. In 1883 he removed to California. He was appointed judge of the Superior Court of San Diego county, California, and later a justice of the Supreme Court of that State. He was for a short time in 1910 a member of the City Council of Los Angeles. He was elected United States senator by the legislature on the first ballot, receiving 92 votes out of 120. He had previously received the nomination in the primary elections in 1910. His term of service will expire in 1917.

WORKINGMEN'S INSURANCE. GREAT BRITAIN. Undoubtedly the most important piece of social legislation of recent years was the national insurance bill enacted by the British Parliament and effective May 1, 1912. This provides insurance against sickness for all wage earners and others whose annual earnings are less than \$800 a year and who are under sixty-five years of age, except soldiers and sailors (separately provided for), pensionable government employees, persons working on their own account, wives working for their husbands, and casual domestics and workers. The total number of insured is estimated at fourteen million out of some nineteen million of the wage-earning population. It provides unemployment insurance for about 2,400,000 men employed in the building and engineering trades. The law marks the combination of the reform movement which was begun by the budget controversy in 1909. In fact it is the natural culmination of the remarkable series of measures for the betterment of the conditions of the wage-earning population which began with the Workmen's Compensation act of 1897. That act was followed by others regulating the hours of labor of children and women, and of coal miners; regulating the dangerous trades; freeing trade unions from liability to suits for damages; providing old-age insurance at the expense of the State for wage earners seventy years of age; establishing minimum wages in sweating trades; creating a national system of employment exchanges. It is not too much to say that these measures are the essential part of the social and industrial revolution through which the English nation has been passing during the last fifteen years.

The administration of the sick insurance system is placed in the hands of a body of insurance commissioners having very broad powers. Weekly contributions, for the payment of which the employers alone are made responsible, are to be levied on both employer and employee. Male employees pay 4d. per week, female employees 3d., and employers for each employee 3d. The government makes an additional contribution of 2d. a week for each person insured.

Photograph by Paul Thompson, N. Y.

THE WOMAN SUFFRAGE PROCESSION IN NEW YORK, MAY 6, 1911
THE SHIRTWAIST WORKERS

For those whose weekly wages are under 2s. 6d. a minimum weekly contribution of one penny is provided. Stamps which are to be pasted on cards weekly or at regular intervals are provided as a means of payment. The payment of indemnities in the case of illness is left with approved societies as regards their own members and to county health committees as regards other persons. Under the term "approved society" come trade unions, clubs formed of policy holders of industrial insurance corporations, and friendly societies. These societies must be self-governing, non profit-making, with sufficiently large membership to give stability, and with medical treatment and money benefits. It is estimated that 86 per cent. of the insured will be members of approved societies. Persons disqualified from such society membership because of physical, mental, or moral defects will make their contributions through the post office. These post office depositors are deprived of invalidity insurance and their sick insurance benefits are relatively small. Those formulating the plan estimated the weekly expenditures per insured to be 7d. This leaves 2d., equaling the government's contribution, from which a reserve fund will be provided. This will cover the extra risks due to the uniform rate for persons of all ages. It is expected that after sixteen years this extra risk will be limited and a surplus developed from which enlarged payments may be made.

The indemnity provides free doctors and free medicines during illness; for the first thirteen weeks 10s. a week to men and 7s. 6d. to women; during the second thirteen weeks and thereafter, if disablement continues, 5s. a week to both men and women. Those paying lower contributions receive correspondingly lower benefits.

The insurance paid after the first twenty-six weeks is technically called invalidity insurance. This may continue until the recipient is eligible for an old-age pension. In addition a special maternity benefit of 13s. is provided for insured female employees and the wives of insured male employees, while in confinement, provided the mother does not return to work for four weeks. This is expected to affect one million mothers annually.

One of the most widely and enthusiastically approved features of the sickness insurance scheme is the provision that an annual appropriation of 1s. 4d. for each person insured, estimated to amount to about one million pounds per year, should be set aside for the erection of sanatoria for the treatment of persons suffering from tuberculosis or other diseases requiring institutional treatment. By this means provision will be made not only for incipient but also for advanced cases of tuberculosis, none of which can be effectively treated in the living quarters of the poor, and the latter of which, heretofore not admitted to sanatoria, are much the more dangerous from the standpoint of contagion. The administration of these sanatoria is in the hands of the local health authorities.

There are a number of interesting special provisions in the sickness insurance scheme. By provision enabling them to pay larger benefits in case their sick insurance payments fall below the normal, friendly societies are induced to keep the sickness of their members at a

minimum. The premium rates for employees getting less than 2s. 6d. a week are reduced for the employee but increased for the employer; this penalizes employers paying starvation wages. The county health committees provided for by the law are given certain powers which will enable them greatly to stimulate the activities and efficiency of the local health authorities. Medical attendance in sickness for all insured persons is to be provided by means of a contract system with physicians, such as now is operated by the friendly societies. Patients are no longer expected to save the doctor's fee by having a druggist prescribe for them, the latter function being expressly preserved to the medical profession.

The bill was widely approved when first presented except by the medical profession. This wide approval was explained by some as due primarily to the political advantages which were expected to be derived from its passage. This doubtless accounts for the unanimity of its support, even the opponents of the government offering only slight modifications in the original bill. The doctors, however, manifested the most violent opposition, mainly on financial grounds. They held indignation meetings in numerous places. Mr. Lloyd-George explained the relation of the medical profession to the new system in detail in both the House of Commons and before the British Medical Association. He took up the assumptions on which the doctors' opposition was placed and showed them to be ill founded. He pointed out that the classes mainly affected by the sickness insurance system were a source of little income but of many bad debts for the medical profession. He showed that the doctors would not be reduced to a dead level, but that, since patients were given an opportunity to choose, superior medical efficiency would win its just reward. Other writers pointed out that the bill would very greatly benefit the medical profession since the greater part of the payments provided therein would go to it. Great stress was laid upon the fact that this system for the first time introduced the right relation between the medical profession and the public health, more stress being laid on prevention than on cure. Moreover, the income of the profession will not depend on the amount and duration of sickness. The opposition of the doctors was in small part overcome by raising the compensation which they were to receive for each patient to a level considerably exceeding that previously received by friendly society doctors. Nevertheless a referendum of the 29,000 doctors of Great Britain showed that out of 20,712 votes received up to December 22, 20,419 were dissatisfied with the bill.

There was also some opposition on the part of the friendly societies who feared the loss of their self-government, particularly the loss of control of their funds and benefits. Their opposition was overcome by conceding to them the right to invest their own funds and the right to appoint the majority of the representatives on the local health committees. Moreover, any competition between the friendly societies and the industrial insurance companies is prevented by giving the right of self-government to the sick clubs of the insurance company policy holders. Though the friendly societies which become "approved" must hereafter

submit to supervision by the government and must make regular valuation of assets and liabilities, the other activities will be unaffected. It is estimated that the trade unions will receive additional income totaling \$12,000,000 under the new law.

The administration of the unemployed provisions of the law is to be supervised by the board of trade, though applying only to the trades mentioned. This board may extend the measure to new employments. The payment of indemnities shall be made through insurance officers and such other agents, including trade unions, public labor exchanges, and post office, as the board of trade may approve. The contributions for unemployment insurance are $2\frac{1}{2}$ d. from each employee, an equal sum from the employer, and an amount equal to one-third of their combined contributions to be paid by the State. The payments in case of unemployment of insured persons shall be 6s. a week in the building trades and 7s. a week in the engineering trades, beginning the second week and limited to fifteen weeks a year. No insurance is to be paid during strikes or lockouts.

Special provisions are introduced in the measure designed to induce employers to keep their force continuously employed throughout the year. Any workman who has paid an unemployment insurance premium for at least five hundred weeks may upon reaching the age of sixty receive back the difference between the amount paid in and the amount received in unemployment insurance, with interest at $2\frac{1}{2}$ per cent. This will not only make the system more attractive but also provide a fund for old age. As a means of checking deception the public labor exchanges will be used to test the opportunities for employment and the competency of the unemployed applicant. Indeed unemployed men may be given a technical training course at the expense of the insurance fund, in order to increase their industrial efficiency.

GERMANY. On May 30, a very voluminous bill of 1754 paragraphs for the codification of the social insurance regulations into one law and for the extension of the system of sickness insurance was passed by the Imperial parliament. The German system of workmen's insurance is divided into three systems—the sick insurance, the accident insurance, and the invalid insurance, the latter including old-age insurance for workmen seventy years of age and over. The sick insurance system now embraces about twenty-three thousand local organizations, with about 13,500,000 members. The number actually receiving sick aid approximates 6,000,000 per year. Sick insurance covers illness of not more than six months' duration; persons suffering for longer periods become charged to the invalid system. The sick insurance plan is on a contributory basis, the employers paying one-third and the employee two-thirds.

The accident system, which was adopted in 1884, imposes upon the employers the responsibility for compensation for injuries to employees due to accident. To meet this responsibility the employers have formed mutual insurance societies, of which there are forty-eight for agriculture and sixty-six for industries and trades. The assessments vary according to trade risks. These insurance societies have a thorough system of inspection for the plants of all policy holders and impose penalties on employers violating the rules for safety. The

third system for invalids and aged persons, adopted in 1889, now insures about 15,500,000 people. The pensions for invalidity average about \$40 per year and for old age about \$36. For this system the assessments bear equally on the employer and the employee and are paid weekly by means of stamps pasted on cards issued by the government. The total revenues of all three systems in 1909 were \$210,000,000; the disbursements \$165,000,000. The invested funds amounted to one-half billion dollars. A careful statistical estimate has shown that the combined contributions equal 6.75 per cent. of the average wages of the insured, of which the employers pay 3.68 per cent. and the employed 3.07 per cent.

The greatest objection to the system is made by certain employers who find the system burdensome; indeed the feeling is general in Germany and well-nigh universal elsewhere that the workingmen's insurance systems are a heavy handicap to German industry. Statistics show that the contributions made by iron and steel companies ranged from 14 per cent. to 47 per cent. of net profits. On the other hand the advocates of the system claim that it has not been a burden and point to the growth in population from 46,000,000 to 65,000,000, to advance from fourth to second place in the world's trade, the doubling of property values, wider diffusion of ownership, the increase in wages and savings, the decline of emigration, the increase of immigration, the betterment of public health, increased longevity, and other indications of industrial and social betterment, since these systems were inaugurated.

The new law provided for the systematic codification of the great body of legislative enactments and official regulations which have grown up in these systems during thirty years. It also provided for the extension of the system of sick insurance to farm laborers, domestic servants, and casual laborers. It was estimated that this extension would increase the contributions of employers for the sick benefits by one-half, or from \$24,000,000 to \$36,000,000 per year. In addition the bill would extend the pension system so as to include widows and orphans of insured laborers, the estimated additional expense being about \$17,000,000. The total additional expense was estimated at \$32,000,000, of which employers and workers would provide \$27,500,000. A further feature of the bill was the great extension of the benefits so as to cover death from all causes, the contributions being equal for employers and employees for this purpose. The bill sought to introduce more economical and efficient management of the sickness associations by centralizing and monopolizing the business in the hands of a smaller number of central associations. It introduced a change also in the assessments for sickness insurance. It provided that employers should contribute one-half instead of one-third and that in return they should have an equal voice with the workmen in the management. Some employers opposed this on the ground of additional expense, but others favored it on the ground that greater control by them would so economize the administration that the expense would not ultimately be increased. The bill at the same time proposed to give workmen equal representation on the boards of the accident associations which determine the ex-

tent of injury and the amount of compensation. This was looked upon as offsetting the reduced influences of the workmen in the administration of sickness insurance. At the same time an entirely independent system for the protection of persons not included in the above labor systems but having incomes of less than \$1200 was put forth by the imperial government.

ADMINISTRATIVE DEFECTS OF GERMAN SYSTEM. The workmen's insurance schemes and experiences of Germany enacted in 1881 have long been objects of study and imitation in other countries. The usual understanding has been that this sickness insurance scheme has been remarkably successful and very efficiently administered. Testimony is still quite uniform that it is successful in preventing the pauperism of workers through illness. But Herr Ferdinand Friedensburg, formerly president of the Senate of the Imperial Insurance Office for twenty years, has recently published a lengthy criticism of the internal workings of the German system. His aim was to expose the evils of the system as administered and not to attack its fundamental principles. He found the one chief source of evil in the administration to be the spirit of charity in which the system is administered. He found that this spirit of charity crept in and contaminated the system from the very beginning. The result has been an enormous increase in injuries for which compensation is given, in the subterfuge of malingering in cases of sickness, and in the number of appeals which are made from original judgments. He points out that employers endeavor in every possible way to escape their burdens and that the annual collection of enormous fines from them is not sufficient to prevent efforts at evasion. Dr. Friedensburg says that employers justly complain of the excessive cost of the insurance system and expresses his belief that it reacts injuriously on the empire's industries. The cost amounts to about two million marks a day. Dishonesty and fraud are everywhere present. He shows that a special class of agents for the fabrication of pensions and compensation claims has developed. No serious attempt is made, however, to suppress these frauds. The writer also shows that neither socialism nor pauperism, the two evils against which the State insurance system was directed, has been destroyed. Indeed, he believed that pauperism had actually increased, basing his contention on the increase in poor expenditures. He concluded that the system is a vicious circle, segments of which are charity, pauperism, and fraud. See SWITZERLAND.

BIBLIOGRAPHY. So extensive has become the movement to provide insurance against sickness, invalidity, unemployment, and old age, that considerable literature bearing on it has been put forth. A number of documents bore on the Lloyd-George insurance scheme in Great Britain. We note the following: *The National Insurance Bill summarized*, by L. W. Evans; *The People's Insurance explained*, by D. Lloyd-George; *National Health Insurance*, by E. J. Schuster; *The National Insurance Bill and the Industrial Agent*, by H. K. Wood. Of a more general nature were: *Sickness and Invalidity Pensions*, by P. Alden; *Social Insurance* (1910), by H. R. Seager; *La nationalisation des assurances*, by E. Buisson; *Die Krankenversicherung der Reichversicherungsordnung nach den Beschlüssen der Reichstagkommission*, by G. Hoch; *Die*

Sozialversicherung als Organisationsproblem by L. Verkauf; *Die Arbeiterversicherung in den Kulturstaaten* (1910), by J. Witonshi; *Social Insurance*, by G. H. Knibbs; *The Prevention of Destitution*, by Sidney and Beatrice Webb.

WORLD'S COMMERCE, 1911. The world's international trade has doubled in value in the last 5 years, and shows for 1911 a larger total than ever before recorded.

Figures prepared by the Bureau of Statistics of the United States Department of Commerce and Labor indicate that the international commerce of the world in 1911 aggregated approximately 35½ billion dollars, against 30 billions in 1907, 24 billions in 1904, 20 billions in 1901, and 16½ billions in 1896. These figures are in all cases a combination of both imports and exports for all the countries for which data are available, and since all articles exported from one country become the imports of some other country the value of the merchandise actually moved may be assumed to be approximately half the sum obtained by a totalization of the imports and exports. Taking the export figures alone, the total for 1911, for the countries for which data are available, will probably approximate 17 billion dollars, against 14½ billions in 1907, 11½ billions in 1904, 9½ billions in 1901, and 7½ billions in 1896. The imports, although composed of articles already recorded as the exports from some other part of the world, are valued considerably higher when imported than the valuation of the same articles when exported, since in most cases cost of transportation and, in some cases, other expenses are added in determining the value of the merchandise when imported. As a result, the valuation of imports into the principal countries of the world in 1911 will probably aggregate about 18½ billion dollars against 16 billions in 1907, 13 billions in 1904, 11 billions in 1901, and 9 billions in 1896. The international commerce of the world, showing aggregate value of imports and exports of all countries for which trade statistics are available, is given below:

Year	Imports	Exports	Total
1896	..\$8,807,000,000	\$7,716,000,000	\$16,523,000,000
1901	..10,839,000,000	9,626,000,000	20,464,000,000
1904	..12,811,000,000	11,322,000,000	24,133,000,000
1907	..15,988,000,000	14,341,000,000	30,329,000,000

WUSTMANN, GUSTAV. A German philologist and historian, died January, 1911. He was born at Dresden in 1844. After studying in the Kreuzschule in that city, he studied philology at Leipzig from 1862 to 1866. He then taught at the Nikolai Gymnasium in Leipzig until 1881, when he was appointed director

of the Municipal Archives and city librarian. From 1879 he was also associate editor of the *Grenzboten*. In 1870 he published *Appelles' Leben und Werke*. He followed this with several valuable contributions to the history of Leipzig. In his *Allerhand Sprachdummheiten* he endeavored to simplify the German language. The volume aroused much opposition. In addition to other works he published a collection of poems, and edited many important works in philology.

WYMAN, WALTER. An American public official, surgeon-general of the United States Public Health and Marine Hospital service, died November 21, 1911. He was born in St. Louis in 1848 and graduated from the University of St. Louis in 1866. He graduated from Amherst College in 1870 and from the St. Louis Medical College in 1873. In 1876 he entered the Marine Hospital service, serving successfully in St. Louis, Cincinnati, Baltimore, New York, and Washington. He gave special attention to the physical conditions affecting seamen of the merchant marine and was instrumental in having laws passed for their benefit. He also brought to the attention of the authorities cruelties imposed on deck hands on western rivers and on crews of oyster vessels in Chesapeake Bay. Through his efforts a hospital was established for the latter. The most notable of his achievements, however, was the passage of the present quarantine laws of the United States in 1893. He had general charge of the administration of these laws. He suggested and established the first government sanatorium for consumptives at Ft. Stanton, New Mexico, and was instrumental in securing the enactment of laws relating to quarantine, quarters, and food for seamen, government regulations, and the manufacture and sale of serum, toxins, etc., and the establishment of a leprosy investigation station at Havana, the creation of a hygienic laboratory at Washington, the establishment of a bureau of public health, etc. He had absolute control of all sanitary regulations in the Philippines, Panama, Porto Rico, and wherever the United States government ruled. He was the author of many pamphlets dealing with public health. He was chairman of many important organizations for the investigation of health conditions and was a member of many learned societies. He was supervising surgeon-general of the United States Marine Hospital service from 1891 to 1902 and was surgeon-general of the United States Public Health and Marine Hospital service from July 1, 1902, until the time of his death.

WYOMING. POPULATION. The Thirteenth Census showed a population in 1910 of 145,965, compared with 92,531 in 1900, an increase of 57.7 per cent. in the decade. The principal cities with their population in 1910 and 1900 are as follows (the figures in parentheses are for 1900): Cheyenne, 11,320 (14,087); Sheridan, 8,408 (1559); Laramie, 8,237 (8,207); Sweetwater, 5,778 (4,363).

AGRICULTURE. The Thirteenth Census included statistics of agriculture. These are of date of April 15, 1910. On that date the farms in the State numbered 10,987, compared with 6,095 in 1900. The land in farms was 8,543,010 acres, compared with 8,124,536 in 1900. The improved land in farms was 1,256,160 acres, compared with 792,332 acres in 1900. The average acreage per farm was 777.6, compared with 1333 in 1900. The total value of farm property,

including land, buildings, implements, and machinery, domestic animals, poultry, and bees, was \$167,189,081 in 1910, compared with \$67,477,407 in 1900. The farms operated by owners and managers numbered 10,090 and those operated by tenants, 897. Of the farms operated by owners, those free from mortgage numbered 7815; those under mortgage, 1923. The native white farmers numbered 9019; foreign-born white, 1903; negro and other non-white, 65. Of the non-whites 44 were Indians, 19 negroes, 1 Chinese, and 1 Japanese. The domestic animals, poultry, and bees were valued at \$65,605,510 in 1910, compared with \$39,145,877 in 1900. The cattle numbered 767,427, valued at \$22,697,387; horses, 156,062, valued at \$12,426,838; mules, 2045, valued at \$248,572; swine, 33,947, valued at \$301,716; sheep, 5,397,161, valued at \$29,666,228. Poultry of all kinds numbered 341,054, valued at \$194,078. The acreage, production, and value of the principal crops in 1910 and 1911 will be found in the following table:

	Acreage	Prod., bu.	Value
Corn1911	13,000	195,000	\$148,000
1910	11,000	110,000	73,000
Wheat1911	69,000	1,794,000	1,687,000
1910	56,000	1,400,000	1,330,000
Oats1911	190,000	6,555,000	3,278,000
1910	161,000	5,152,000	2,576,000
Rye1911	2,000	40,000	36,000
1910	1,000	18,000	15,000
Potatoes ..1911	10,000	420,000	582,000
1910	9,000	900,000	732,000
Hay1911	330,000	a 693,000	7,138,000
1910	300,000	720,000	9,000,000

a Tons.

MINERAL PRODUCTION. The production of coal in Wyoming in 1910 exceeded all previous records in quantity and value. From an output of 6,393,109 short tons valued at \$9,896,848 in 1909, the production increased to 7,533,088 short tons, valued at \$11,706,187. The increase was 1,139,979 short tons in quantity and \$1,809,339 in value. The gain in output and the advance in price were due to the shortage of coal for railroad, manufacturing, and domestic use in the States of the East, caused by a six months' strike among the miners in the Central and southwestern States. The increase in production in 1910 was general throughout the State. The most important increases were in Sheridan, Sweetwater, and Uinta counties. The number of men employed in the production of coal in the State during the year was 7771. There were strikes in the State during the year, but they affected only 1196 men, and their idleness did not appreciably affect production.

Some copper is produced in the State. The output in 1910 was 217,127 pounds of blister copper, as compared with 433,672 pounds in 1909. The encampment district, the most important producer, was not active in 1910 as the principal company was engaged in litigation which prevented the operation of its property.

The State produces a small amount of gold and silver. In 1910 the output of gold was 1478 fine ounces, valued at \$3199. The silver production was 1478 fine ounces, valued at \$798. In 1911 the gold production was 909 fine ounces, valued at \$18,791 and the silver production was 1009 fine ounces, valued at \$555.

MANUFACTURES. The Thirteenth Census included statistics of the manufactures in the

State. These figures covered the calendar year 1909. The results will be found summarized in the table below. While the value of the products of the manufacturing industries are inconsiderable in bulk, they show a marked increase in the five year period 1904 to 1909. In that time the establishments increased from 169 to 268, while the capital more than doubled. The manufactures having the largest value of products are those connected with cars and general shop construction and repairs by steam railway companies. These products were valued at \$2,337,000. Next were lumber and timber products, valued at \$751,000; flour and gristmill products, \$741,000; printing and publishing, \$490,000. The total number of persons engaged in manufactures in the State in 1909 was 3393, of whom 3313 were male and 80 female. The prevailing hours of labor in the manufacturing industries of the State ranged from 60 to 72 per week, or from 10 to 12 a day.

The following table gives a summary of the results of the census for the calendar years 1909 and 1904, with the percentage of increase for the decade:

	Number or amount 1909	1904	Increase 1904-1909
Number of establishments	268	169	58.6
Persons engaged in manufactures	3,393	2,163	56.9
Proprietors and firm members	263	150	75.3
Salaried employees	263	179	46.9
Wage earners (average number)	2,867	1,834	56.3
Primary horsepower	7,628	3,604	11.7
Capital	\$6,195,000	\$2,696,000	129.8
Expenses	5,594,000	3,189,000	75.4
Services	2,392,000	1,467,000	63.1
Salaries	311,000	206,000	51.0
Wages	2,081,000	1,261,000	65.0
Materials	2,608,000	1,301,000	100.5
Miscellaneous	594,000	421,000	41.1
Value of products	6,249,000	3,523,000	77.4
Value added by manufacture (value of products less cost of materials)	3,641,000	2,222,000	63.9

FINANCE. The report of the State treasurer for the fiscal year 1911 shows total receipts in the treasury from all sources during the year of \$1,069,970. The total disbursements amounted to \$967,568. About one-half the total receipts comes from the direct property tax. Aside from this source of revenue the commissioner of public lands furnishes the largest source of income, \$255,469. The largest single item of expense is that for the maintenance of the State penal and charitable institutions, which amounts to \$182,808.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the State Hospital for the Insane at Evanston, the Wyoming Penitentiary at Rawlins, Wyoming Soldiers' and Sailors' Home at Buffalo, the Big Horn Hot Springs Reserve at Thermopolis, the Wyoming General Hospital at Rock Springs, the Wyoming General Hospital at Sheridan, the Wyoming General Hospital at Casper, and the Home for the Feeble-Minded and Epileptic at Lander.

POLITICS AND GOVERNMENT. The legislature met in 1911 and passed several important measures. Among these were a joint resolution submitting to the people an amendment to the constitution establishing the initiative and referendum, and an act providing for the nomination

of candidates for public office by direct primary. On January 25, Clarence D. Clark was reelected to the Senate by the legislature.

STATE OFFICERS. Governor, Joseph M. Carey; Secretary of State, F. L. Houx; Treasurer, J. L. Baird; Auditor, R. B. Forsythe; Adjutant-General, M. C. Barkwell; Attorney-General, Douglas A. Preston; Superintendent of Public Instruction, Rose Bird—all Democrats, except Baird, Barkwell, and Forsythe.

JUDICIARY. Supreme Court: Chief Justice, Cyrus Beard; Associate Justices, Richard H. Scott, Charles N. Potter; Clerk, W. H. Kelly—all Republicans.

STATE LEGISLATURE, 1911. Republicans, Senate, 19; House, 29; joint ballot, 48. Democrats, Senate, 8; House, 27; joint ballot, 35. Republican majority, Senate, 11; House, 2; joint ballot, 13.

The representatives in Congress will be found in the article UNITED STATES, Congress.

WYOMING (SHIP). See BATTLESHIPS.

XERASE is a mixture of specially prepared dry beer yeast 150 parts, grape sugar 20 parts, white bole 125 parts, and a mixture of nutritive salts 3 parts. It is a yellowish-gray powder having a weak odor of yeast and a salty taste. It is only slightly soluble in water and resists ordinary atmospheric conditions. This mixture is said to be absorbent on account of the bole and induces fermentation owing to the sugar and salts. The yeast is said to have a bactericidal action on pus-producing organisms. The mixture is useful in inflammations and ulcerations of mucous membranes and in the treatment of putrid wounds, ulcers, inoperable cancer. It may be applied as a powder by insufflation, or inserted into the mucous cavities in a gelatin capsule.

YALE FORESTRY SCHOOL. See FORESTRY.

YALE PERUVIAN EXPEDITION. See EXPLORATION.

YALE UNIVERSITY. The total number of students in all departments of the university in 1911-12 was 3229, divided as follows: Graduate school, 408; college, 1236; Sheffield Scientific School, 1118; art school, 579; music school, 94; forest school, 57; department of theology, 101; department of medicine, 63; department of law, 173. On the faculty were 524 members, of whom 127 were professors, 89 assistant professors, 138 instructors, 71 assistants in instruction, and 99 assistants in demonstration. The total gifts and bequests to both income and principal of the funds of the university for the year 1910-11 amounted to \$1,134,385, as compared with \$2,398,291 in 1909-10. An important gift was one of \$20,000 made by Mr. Francis E. Loomis for research work in the chemical department. During the year the new addition to the art school was completed and the Mason laboratory of chemical engineering, the gift of Messrs. George Grant Mason and William Smith Mason of the Sheffield Scientific School, was brought nearly to completion. Work progressed also on the new Sloane physics laboratory, the gift of Messrs. William D. Sloane and Henry T. Sloane. The total university funds at the end of the fiscal year 1911 amounted to \$13,338,765. For additional notes in regard to the university in 1911, see UNIVERSITIES AND COLLEGES.

YAPURÁ RIVER. See EXPLORATION.

YASS-CANBERRA (AUSTRALIA). See MUNICIPAL GOVERNMENT.

YOUNG MEN'S CHRISTIAN ASSOCIATION. The total membership of the association in 1911 was 934,934. The associations occupied 1697 buildings, valued at \$68,699,150, and there were 1697 paid general secretaries. In North America there were 2118 associations, with 536,037 members. In the educational classes conducted by the association there were 61,904 students; in physical work, 284,842; and in Bible classes 101,546. The North American International Committee is composed of 65 members. Alfred E. Marling, chairman; F. B. Schenck, treasurer; R. C. Morse, general secretary.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION OF THE UNITED STATES OF AMERICA, NATIONAL BOARD OF. The board includes 196 city associations, 667 student and 12 industrial and rural associations, with a membership of 228,757 young women. There are 14 territorial and State organizations.

The third biennial convention of the association was held in Indianapolis from April 19-24. In its deliberations special emphasis was placed on social questions and the convention put itself on record in favor of the living wage and improved industrial conditions for women. Among the speakers were Dr. Wilfrid T. Grenfell, President King of Oberlin College, Bishop E. H. Hughes, and Dr. Robert E. Speer.

YTROFLUORITE. See MINEROLOGY.

YUAN SHIH-KAI. A Chinese statesman who became in 1911, as a result of the revolutionary activities in China, premier of the Chinese Empire. He was born in the town of Chengchau in the province of Honan. He is of the Chinese or Han race, as distinct from the Manchu. His parents were in moderate circumstances and at the age of 19 he removed to Tientsin, where his uncle was taotai. This relative sent him to the viceroy of Shantung, who made him a member of his own family and gave him equal educational advantages with his own children. His fondness for military life resulted in his accompanying the viceroy of Shantung to Korea as a petty military officer. Here he became familiar with Korean politics. His work in Korea gained the favorable notice of Li Hung Chang, who at that time was in power and the latter soon appointed Yuan resident-commissioner of trade in Korea. This was his first official title and his power was, in fact, that of minister-resident. It is alleged that to him was due in considerable measure the Japan-China War of 1894-5. He fell temporarily into disfavor with Li Hung Chang, but by the influence of powerful friends a reconciliation was brought about and Yuan was appointed to superintend the organization of a new army. He did not himself take an active part in the actual work of organization, but engaged to assist him a German and a Norwegian officer. These men created what became famous as the "Army of the North." When Yuan took command of this body it was composed of about 5000 men. He gradually increased the number to about 12,500. Under the patronage of Li Hung Chang, Yuan's rise was rapid. He became familiar with foreign politics, although not favorably inclined toward foreigners. He came to see, however, the necessity of introducing occidental methods in Chinese affairs. During the war with Japan

he took sides with the progressives and shared the confidence of the leaders of the reform movement. At the same time he, through the influence of members of the royal family, won the favor of the dowager empress, Tzu Hsi An, and she gave to him the virtual command of the Peiyang army, although he was not nominally the commander. The attempts of the emperor, Kuang-hsu, to bring about reforms by issuing a series of reform edicts in 1898 brought about strenuous opposition on the part of the Manchu officials, whom these measures would throw out of office. The emperor called upon Yuan to take command of the newly formed army and to bring the forces to Peking. In order to do so he was to dispose of Jung-lu, the nominal commander, and a great favorite with the dowager empress. Instead of obeying the commands of the emperor, Yuan gave the order to Jung-lu, thus betraying the designs of the emperor into the hands of his enemies. For this act he was rewarded by the dowager empress with the junior vice-presidency of the board of works, and in 1899 she made him acting governor of Shantung. In 1900 he was raised to the full dignity of the governor of that province.

During the Boxer rebellion Yuan gained an international reputation as a result of his efforts to protect foreign legations. It was through him that the news of the outbreak reached Washington through a secret channel. He was at all times opposed to the Boxer element and it is alleged that in the early days of the uprising he invited a number of the Boxer leaders to his palace to attend a banquet. After listening to their boasts that the foreigners should be destroyed and that they could not be harmed by foreign bullets, he requested them to stand outside in a row that they might prove this miraculous power. He then called in his soldiers who were commanded to fire upon these leaders and they were all instantly killed. His attitude toward foreigners had won their sympathy and confidence, so that in the days following the Boxer uprising he was looked upon by the foreign representatives as the "strong man of China." He also had the favor of the dowager empress and his power at the beginning of 1906 was considerably greater than that formerly possessed by Li Hung Chang. He was viceroy of Chi-li, head of the Peiyang army and navy administrations, and a high official in many other bodies. During the Russo-Japanese War he was active in preserving Chinese neutrality. He undertook many reforms, including the abolition of the classical system of examinations, the encouragement of the military provisions, and stringent anti-opium legislation. As a result of intrigues of the court party, which had become hostile to him, his influence declined by the middle of 1907; and after the death of the emperor and dowager empress in August, 1908, he was dismissed from office. No reason was given for this action, but it was evident that he had become too closely identified with the anti-court party. He remained in retirement until the successes of the revolutionists in various provinces made plain the necessity of a strong man at the head of the government. The events dealing with his assumption of the office of premier will be found noted in the article CHINESE EMPIRE.

YUKON. An organized territory (since June 13, 1898) of the Dominion of Canada.

Area, 196,976 sq. miles; population June 1, 1911, 8512, compared with 27,219 in 1901. Capital, Dawson (population 3013). Yukon is administered by a commissioner (1911, Alexander Henderson) aided by an elective legislative council of 10 members. See CANADA.

ZANZIBAR. A British protectorate on the eastern coast of Africa, including the islands of Zanzibar (640 sq. miles), Pemba (340), with the small islands adjacent thereto; and also the territory which is known as British East Africa to a depth of ten miles from the coast.

ZAPATA, EMILIANO. See MEXICO.

ZIEM, FÉLIX. A French artist, died November 11, 1911. He was born at Beaume in 1821 and studied at the art school of Dijon. He traveled extensively in the Orient and Italy and on these journeys obtained most of the materials for his paintings. He was one of the last representatives of the school of painters of the romantic school, which devoted its art to depicting the life and color of the countries along the Mediterranean. Among the painters of that school he was admired for the intensity of his colors and especially the brilliancy with which he painted the skies of Venice. The most notable collection of his works is in the Petit Palais at Paris. Many of his paintings are in private collections in the United States. Several of his paintings were admitted to the Louvre although the rules of that administration do not admit the works of artists before they have been dead ten years.

ZIMBALIST, EFRAM. See MUSIC.

ZOOLOGY. As has been indicated in previous YEAR BOOKS, zoölogy at the present day, while in part carried on along the older lines of descriptive morphology, has to a very large extent turned to the experimental method from which in the present state of the science much more fundamental and important results are to be expected than from the older methods. Examples of these lines of investigation are breeding experiments bearing on the study of heredity, experimental embryology, and regeneration experiments, and studies on animal reactions to external stimuli, where the zoölogist and psychologist find their interests overlap. Since in zoölogy as in other sciences most new discoveries are published in technical journals rather than in book form, a result of the increased interest in these subjects and of the tremendous output of papers has been the establishment of journals, especially for experimental work. Much valuable material is to be found also in connection with breeding experiments in the publications of government experimental and other stations. This makes the work of the reviewer more difficult as it is impossible to be sure of having seen all important papers. What follows deals more especially with descriptive zoölogy. For more general results, see BIOLOGY. See also BOTANY, PSYCHOLOGY, FISH AND FISHERIES, ENTOMOLOGY, ORNITHOLOGY.

PROTOZOA. Woodruff continued during the year experiments which in their results corroborated those of earlier years with reference to the question of the necessity for conjugation in *Paramecium*. Under normal conditions it is probable that most individuals have an unlimited power of reproduction without conjugation. These results necessarily modify conclusions previously held concerning the meaning of conjugation with reference to the problem of sex. Jennings stated that conjugation is fol-

lowed by a period of greater variability, which may or may not be in a favorable direction. Ulehlá studied flagellar motion in various organisms, using the paraboloid condenser of Zeiss which shows small objects as brightly illuminated on a dark background. He concluded that flagellæ move backward and forward in a single plane instead of with an action of rotation, as is generally supposed.

CŒLEUTERATES. Annandale recorded the occurrence of a fresh water medusa, which he thought identical with *Limnocnida tanganyika* from a small stream in the western Ghats, India, at a distance of over 500 miles from the mouth of the stream. Jungersen described a new hydroid *Ichthyocodium sarcotretis* which covered more or less of the surface of the parasitic copepod *Sarcotretes*, attached to the fish *Scopetus glacialis*. The hydroid has polyps without tentacles, and medusæ buds which develop into free medusæ.

MOLLUSKS. Drew studied the copulation process in the squid *Loligo pealii* and stated that the spermatophores are carried by the left ventral arm of the male, and fastened in the mantle chamber or on the outer buccal membrane of the female. The eggs are not fertilized in the oviduct, but either in the mantle chamber or while the egg strings are being held by the arms of the female. The egg strings are stuck to some firm object, being pressed tightly against it by the arms. Parker decided that the foot in gastropods is used as a hold-fast by the aid of sticky secretions and by strong suction. Locomotion is with or without pedal waves, in the latter case the method being still obscure. In the former, locomotion is the combined result of local forward motion on the part of one section after another until the whole foot is moved.

CRUSTACEA. Andrews published an elaborate description of the organs of sperm transference in the crayfish *Cambarus*, in which this organ is very highly developed, as compared with other crayfish, some of which have none at all. Although the sperm of the crayfish is injured by water it is transferred by this organ without injury, under water. Herrick published, as a Bulletin of the United States Bureau of Fisheries, the "Natural History of the American Lobster," an important paper discussing the natural history of the lobster, with suggestions as to the conservation of the supply.

FISH. Parker experimented on the olfactory reactions of the killifish *Fundulus*, and concluded that the killifish, like the catfish, uses its olfactory organ for finding its food, but that the eyes are used in this activity much more than they are in the catfish. Sheldon in the dogfish found that they react almost entirely to sight stimulations, and will not find their food if their nostrils are plugged with cotton.

Bean and Weed showed that color changes in fish may occur with very great rapidity, an observation easy for anyone to confirm who can watch fish in captivity. According to Bean and Weed, the cause is mainly psychic (as fright, curiosity, anger), sexual, or due to environment. In a preserved specimen of fish, the question as to whether or not it will retain its original color is due largely to conditions of preservation, as well as to the condition of the fish at the time of preservation. Von Frisch showed that in frogs and minnows the color changes

are due to stimulation passing to the pigment cells over the sympathetic system. The luminous organs of fish were studied by Ohshima, who found that in sharks these organs lack definite numerical arrangement and are merely diffuse minute epidermal swellings partly sunk in the cuticle. In the Sternoptychidae they are arranged in a definite order and are limited in number. Their structure is complicated. Luminosity in sharks is faint and diffuse.

In the United States and in Europe much attention is paid to the fisheries question from an economic point of view. (See FISH AND FISHERIES.) The International Council for the Exploration of the Sea, maintained by several European countries in coöperation, has been especially interested in the question of the chemical composition of the sea water, and published several bulletins in 1911. These bulletins dealt also with the technique of deep-sea explorations. In this connection the study of the plankton is important, as furnishing ultimately the food of all marine organisms. Herdmann and Riddell described their plankton investigations on the west coast of Ireland, and found a curious alternation between the phyto- and the zoöplankton. The phytoplankton in the Irish Sea reaches its maximum in April and early May, when it is replaced by the zoöplankton. In the fall the phytoplankton again becomes predominant, but disappears in winter, when a very scanty zoöplankton is present. This does not hold all along the Great Britain coast, however, as conditions proved to be quite different in Scotland from what they were in Ireland. Dakim stated at the meeting of the British Association, as a result of a series of observations, that marine animals must get a large proportion of their nutriment in a chemical form, directly from the sea water. Estimating, for example, the amount of organized food in a liter of sea water, he tried to show that an animal like a sponge would have to pump through its tissues much more water than it would be reasonable to suppose it does, in order to get sufficient nutriment. Objection was made, however, that there is no substance in sea water which could serve as food, which would not be attacked and devoured by bacteria.

Werner described the sleep of *Amiurus*, which sleeps lying on its side, either at the surface or in contact with water weeds. The animals are perfectly healthy, and this posture is in no sense due to a pathological condition. *Misgurnus fossilis* and *Cobites taenia*, both in nature and in an aquarium, show the same habit. Romeis described, also, a similar observation for *Paratilapia multicolor*, the animal remaining in this position for one-half to two hours. The Danish steamer *Thor* in 1908, 1909, and 1910 collected large numbers of the young of the conger eel, varying in length from 9 mm. up to about 160 mm. They may easily be identified by characteristic markings, and through the number of somites. The spawning of the conger probably takes place in the spring and summer, in the Mediterranean and in the Atlantic off Gibraltar. The eggs of the conger have not been seen. The common eel spawns in the Atlantic, but we do not know just where

except that it must be beyond the continental slope. J. Stuart Thompson concluded as a result of experimentation that the vibratile fin of the rockling, instead of functioning as a lure, is really a device for producing a current of water over the numerous terminal or taste buds on the back of the fish. Shelford studied the distribution of fishes in a series of small lakes concentric with the head of Lake Michigan. Here he was able to trace a definite relation between the age of the lake and the character of its fish population. The young lake has comparatively clear water, but as it grows older it becomes filled with vegetation and better stocked with animal forms. The oxygen content must thus grow less with age. Thus fish which demand clear water will live in a young lake, but find conditions unfavorable in an older one, and will gradually be replaced by forms adapted to different environmental conditions. The conditions which favor the adult life of the fish are quite contrary to those favoring the development of their eggs. The practical result follows that in selecting a lake for stocking with fish, one should remember that the feeding and breeding interests are antagonistic, and should select a lake showing a proper balance between the two.

AMPHIBIA. Kreff described a Dutch East African frog, *Nectophryne tornieri*, in which the young apparently undergo their entire development inside the mother. In one female were contained thirty-four young, developed to the point where the tail had entirely disappeared. He was unable to decide as to the time and manner of fertilization of the eggs.

MAMMALS. According to Hollister, the muskrat, in spite of constant trapping, is more than holding its own in North America, and bids fair to be our most valuable fur-bearing animal. Its fur is constantly advancing in price. Miller found that the brown rat may breed in any month in the year, and that five or six litters with an average of ten young may be a usual record for a year. Sexual maturity is reached by the end of the fourth month. This information is significant in view of the importance of the rat as a carrier of disease. Evermann reported during the year that two fur seals, which were brought to Washington in June, 1910, were alive and well in September, 1911, and had more than doubled in weight. Evermann suggested that the information concerning the habits and needs of these animals may be utilized in establishing young seals in natural breeding grounds. These might be upon inland lakes, as the animals seem not to be injuriously affected by fresh water.

EMBRYOLOGY. It has generally been believed that in animals with three body layers the sex cells arise in the middle layer. Allen stated, however, that in *Amia* and *Lepidosteus* the sex cells are entodermal in origin, migrating after their formation to a final position in the mesenchyme. He thinks that not all animals are alike in this respect, some perhaps forming the sex cells more in the generally accepted way, though in amphibians there is reason to believe that they arise in *Amia*.

ZULULAND. A district attached to NATAL (q. v.).
